Isn't scoping as a set of applying currently adopted policy under law a set of principles that evolves over time? Therefore if the time line is until 2020 then current planning must evaluate the flow that goes back--as well as forward, rather than be stuck in a static land use notion that appears to be one of urban sprawl taking of more and more pristine land in outlying areas that could instead be protected to sustain our lives with our cleaner air, water and soils?

I would plan differently. Perhaps you have another two plans that have not been shared with the public?

I would imagine:

Plan A for Future Development as one imagines the Lab Stays forever

Plan B if the lab goes--then convert to educational facilities

Plan C if the lab stays for only the next contract period

As I understand it, the LBL is portrayed as the brainchild of the 3 Labs under the University of California contract with DOE. The Lab conducts threshold research where theoretical one-off design models are invented and then go to industry for the appropriate applied testing. Now, that the future of the location of the Lab is in question. At the May 15, 2003 Board of U C Regents Meeting former President Atkinnson and Ambassador Linton Brooks (the current Director of the National Nuclear Safety Administration), brought into the open that the DOE is requesting the University administration to competitively bid on the next contract. The discussion covered the possibility of the Lab leaving Berkeley and going to the University of Texas or elsewhere. Either the contract will be renewed or the contract will be cancelled. The continuation of the DOE Lawrence Berkeley National Laboratory under the present arrangement at the Berkeley/Oakland site on University land will be no more.

In national politics dominated by a Republican administration, Republican Senate and House majorities in Washington DC, there is less support for the dominantly Democratic Party San Francisco Bay Area economy and the University of California Systemwide. Contrast this with much support to contract with research centers and universities in Texas.
Such a shaky future bears enormous implications, not only for the University's budget, but also for the entire Bay Area economy.

V. Pivotal questions that are being discussed far and wide are not at all addressed in the LRDP 2004 initial study. In my experience working for a County Supervisor in the 1970's, these questions would normally fall within the scope of modern planning. To begin, a few are:

What projects would leave with the Lab contract?

What scientists and support staff would leave?

What offices and building would be vacated? What is the projected number of gross square feet (gsf)?

What percentage of the average daily population would no longer be driving to the Lab?

Would the bus service leave and no longer transport faculty and staff to the present stops?

Would the Lab take moral authority and complete the designated clean up of the toxic ‘stains’ from chemical and radioactive waste in the groundwater, soils, creeks, and vegetation before it closed down?

Or, would the University be left with the toxins problem that has been accumulating for 60 years?

To what degree would that cleanup extend: to a zero tolerance of a full clean up level as requested by the City of Berkeley?

Or, would the clean up be ignored, as is the tendency on many former military bases?

Or as knowledgeable community members fear, will we be mind-boggled with the public relations outbursts to control public outrage?

VI. A CONPREHENSIVE ALTERNATIVE ANALYSIS to revisit the two planned projects, Building 49 and the Molecular Foundry of 2003 that somehow escaped the current planning that you opened in 2000.

One could argue that the concept and plan for the Molecular Foundry is not unique, it is DUPLICATIVE of other MF’ under DOE in other parts of the country and therefore is an "extra"one. Those other sites have buffer zone perimeter, which safeguard the laboratories while this proposed building site in the Strawberry Canyon Watershed does not. To my knowledge those other foundries do not have to consider firestorms, earthquakes, and landslides and are not located in an area at high risk for terrorism under the Homeland Security designation. A full EIR with public imput would have given you details on these issues to answer to. Please revisit these considerations; these projects belong to the land base and therefore are within the scope.

VII. What follows is taken from a letter that I sent to Senators Boxer and Feinstein in October 2003 expressing my opposition to the Nanotechnology Molecular Foundry appropriation for LBL’s Berkeley Campus after the project was certified by the Regents.

"On the Energy and Water Bill conferencing, please consider eliminating the funding for MOLECULAR FOUNDRY for the Lawrence Berkeley National Laboratory and setting a MORATORIUM on the project until we have a thorough discussion about the health and environmental implications of molecular nanotechnology. We should also have a firm and grounded understanding of any associated hazards, likelihood of accidents, and whether it should be sited in a secure area away from densely populated areas…

Nowhere is this facility PROPOSED AS EDUCATIONAL for a university community…

The scientific community knows very little about the health and environmental impacts of molecular nanotechnology.

On July 8, 2003, the US EPA, through its National Center of Environmental Research, released a Request for Applications entitled "Impacts of Manufactured Nanomaterials on Human Health and the Environment" in which it states "There is a serious lack of information about the human health and environmental implications of manufactured nanomaterials, e.g., nanoparticles, nanotubes, nanowires, fullerene derivatives, and other nanoscale materials.
Table 1 provides an outline of nanostructures, their size, and material into which they may be formed, indicating the type of application in which they may be used. Environmental and other safety concerns about nanotechnology have been raised (Dagani, 2003; Masciangoli and Zhang, 2003; Service, 2003). As part of EPA's mission
to protect human health and the environment, this solicitation requests research proposals which address potential health and environmental concerns of nanomaterials." See, http://es.epa.gov/ncer/rfa/current/2003_nano.html for the full document.

Given our lack of knowledge about the potential health and environmental effects of this new and untested technology, should we not ensure that it would do no harm? Should we not wait until we, the public, are satisfied that scientific due diligence has been conducted and no harm to life and the environment is shown before this technology is released upon the world?

Here are other reasons that funding and building the Berkeley facility is inappropriate:

The proposed Foundry is duplicative—the National Nanotechnology Initiative lists several other Foundries with the very much the same research plans.

All of those foundries are at SECURE sites; LBNL has no buffer security perimeter to protect nearby classrooms and homes

It is advertised as a user facility where "…what could you make if you could build things atom-by atom?"

and"…to develop and study both "soft" (biological and polymer) and "hard" (inorganic and fabricated) nanostructures and how they can be assembled."*

Any facility that creates experimental human, animal, and plant life forms (biological life) then destroys that life in thousands of trials, raises again the issue of when does life originate and who has the right to destroy each life? This is troubling for theological thinkers. Just imagine the implication of this?

Thank you for your kind attention,

Very truly yours, Jennifer Mary Pearson, Ph.D., Berkeley, Ca 94709

LRDP-EIR@lbl.gov
Comments on Draft EIR for LBNL Long Range Development Plan
November 25, 2003

1) Transportation:
The LRDP EIR says that it will analyze the impact of increased traffic (checklist, page 18). Although the plan says that it will "promote alternate forms of transportation" (page 10), it also says that it will provide parking to support an increased population. On page 5 of the report it states that the "current objective" for LBNL's parking is 1.7 employees per parking space (0.59 spaces/employee). Based on the figures provided on page 5 the current ratio is 0.53 spaces/employee (2200 spaces for a daily population of 4300), thus the current objective is to increase not just the absolute amount of vehicular traffic, but the relative amount as well. This is not consistent with the goal to promote alternate forms of transportation.

The current level of vehicular traffic already contributes to significant congestion. Increased traffic will not only add to congestion, but will also make alternate modes such as walking and bicycling less safe, and less attractive. The EIR will need estimates of the current mode split, plus estimates of future mode splits. Any estimates of future bicycle or pedestrian access must account for the detrimental effects of increased vehicular traffic.

The lab currently encourages alternate transportation through a lab shuttle. The EIR will need estimates of the degree of mode shifting that can be expected from increased incentives. The EIR should examine monetary incentives such as subsidized transit, or direct pay-out, time incentives such as increased frequency of shuttle service, satellite parking with shuttle access, more shuttle routes and extended service in mornings or evenings, and increased ease of access via better bicycle lanes, more point of use bicycle parking, and possibly an exterior escalator or moving walkway for improved pedestrian access.

Bicycle and pedestrian access via Strawberry gate is influenced by the condition of Centennial road. Currently, pedestrian access is unsafe due to slip hazards adjacent to the fence of the Botanical garden. Night time bicycle egress is unsafe because of insufficient street lighting and a road geometry that aims vehicular lights directly into opposing traffic. The EIR needs to address the possibility of cooperative agreements with other entities in the upgrading and maintenance of access routes to the lab.

2) Space use efficiency

Page 10 states that a draft policy of the LRDP is to “replace old low density with new space efficient facilities”. Pages 7 and 8 show that current space use is 409 square feet per employee, and that the planned expansion is 667 square feet per employee. The issue of what constitutes space efficiency in a modern setting needs to be explored more fully.

Most of the current lab buildings appear to be from 1 to 4 floors high. The planned molecular factory is 6 stories. The EIR needs to distinguish between gross square feet and the added footprint of planned construction. Impermeable surface area should be listed as building, parking lot, and road or other surface. The impact of new buildings needs to include any added lots or access roads.

Currently, there appear to be no parking structures on the hill. Planned expansions which only include parking lots will have a much larger impact on the built footprint in the lab area than would equivalent construction with parking structures. In addition, existing parking lots could be converted to parking structures to either provide parking for new construction, or to allow conversion of other lots back to open land as a mitigation measure.

3) Page 10 states that a draft policy of the LRDP is to “Promote infill development sites reinforcing the cluster concept”, and also states that a goal is “Site development adjacent to existing development and utilities”. The latter goal is sufficiently vague that it could apply to essentially any site along the current road system, as well as a number of sites off of it. The two current construction plans, the molecular foundry and building 49 are both examples of development adjacent to existing development. Currently the Bevatron and old-town areas of the hill have undergone some degree of decommissioning and dismantling, and are not being intensively used. In terms of the first goal, these appear to be prime areas for planned expansions. However, these are also sites which have been contaminated by past activities. If they are not cleaned up in a timely fashion, they will not be available for future expansion. The draft EIR needs to address the questions of funds, the degree of clean up required to reclaim these sites for potential use, and the timing issues involved. If these sites cannot be reclaimed during the LRDP period then there is much more limited possibility for infill development, and there should be a serious question as to whether further growth on the hill is acceptable during this period.

4) The proposed plan is to add up to 1200 new staff. This presupposes growth in research needs in the national laboratories plus some allocation of that growth to LBNL. The EIR should address the planned or estimated overall expansion of research in the national laboratories, and the degree of coordination between the labs in handling this growth. Some of the labs have may more room for growth than some of the others, and there may also be a potential for the development of new national laboratories. It should not be presumed that growth is either desirable or necessary for this site.

A major advantage of the LBNL site is its proximity to UC Berkeley. Currently LBNL has about 5% of its space off-site on the UC campus, and has another 15% in lease space. The proposed LRDP appears to assume no or even negative growth in these off-hill sites. In addition, the proposed plan emphasizes research clusters, which would presumably be incompatible with off-site space. The plan does not address the counterbalancing potential benefits of off-site space: better access to and increased collaboration with UC Berkeley, and a wider access to buildable sites, with better transit access and less environmental impact. These issues need to be evaluated in the EIR.

Comments of Long Range Plan
From:
Howard Matis <matis@comcast.net>

To:
TPowell@lbl.gov

Terry,

I could not attend the Long Range Planning Meeting. Please forward these comments to the Long Range Process.

I understand that many residents want Lab Employees to take public transportation. It certainly laudable and better for the environment if everyone takes public transportation. However, the facts of life in our area is that for many people public transportation is not practical and the LBNL long range plan must take into account that many employees must drive to work. There is no evidence that public transportation will get better. Planning must reflect that fact. Restricting car access to the laboratory will not reduce the number of cars. It will just make the current situation worse.

Here is a recent example of the problem with public transportation. I built my house in a place that had public transportation. Recently, AC Transit proposed to remove our bus service and to others who live in hill areas. As Berkeley residents in general did not support restoring the service to the Hills, many hills residents have lost public transportation. There is no suitable public transportation in my neighborhood.

Many laboratory employees have no access to public transportation. They must drive their cars or not go to work. The current political climate does not support public transportation in all areas, therefore the LBNL plan must include the fact as there will be a segment of employees who must drive to work.

It is clear driving to work causes congestion in Berkeley. The longer cars are tied up in traffic, the more pollution. Therefore, the laboratory should explore ways to improve the traffic flow. (Discouraging traffic is ineffective and leads to more congestion).

The following ways should be explored to speed up traffic:

1) Stop signs should be replaced by traffic lights wherever possible - especially upon approaches to the laboratory.
2) On streets with congestion near the University, there should be no parking during commute hours.
3) The intersection near I-House is a major problem and should improved. For instance, the "no standing" sign near I-House should be enforced. The University should ban commercial deliveries during commute hours.
4) Gayley Road is a transportation nightmare. The possibility of lowering the road and adding pedestrian overpasses should be explored.

The lack of employee parking causes extra travel time as employees take a long time to find an available spot.

1) Extra parking places need to be created to eliminate this extra driving time. With less driving time there will be less air pollution.
2)The laboratory should explore ways of concentrating parking areas near employees work locations. Making a more efficient allocation of parking rather than increasing the number.

To:
lrdp-eir@lbl.gov

Dear Jeff,

I would like to add this comment to my comments made earlier tonight. Please include in the EIR an estimate of the % of the LBNL Hill Area land that will be built out at the completion of the LRDP in 2025. In other words, what percentage of the total land mass will be buildings and what percentage of the total
land mass will be parking lots , etc.

The visual rendering in one of the posters tonight was misleading because the LBNL borders were not well-marked. By including UCB land, the relative building density looks more spacious than it probably is. By reporting the percentages, it should clear up any confusion that the interested public might have.

Thanks.

Janice Thomas

Environmenal Planning Coordinator
Lawrence Berkeley National Laboratory
One Cyclotron Road
Berkeley, CA 94720

Dear Mr. Philliber;
The Urban Creeks Council of California is very concerned about the proposed development, both short term and long term at LBNL. The impacts of the proposed projects to the ground water, the streams, vegetation and both human and animal health and safety are potentially quite dangerous. Therefore we make the following five recommendations:

*That a moratorium be placed on any new construction at LBNL until it is decided whether the DOE projects will be moved to Texas, and

*That the DOE be required to clean and detoxify all the existing buildings and land that they have vacated and promised to remediate and have not, and

*That there be no new buildings or facilities constructed on any land that is now open space, and

*That whoever manages this site develops a master plan for the cleanup, ecological restoration and maintenance of the headwater streams of the USA.

*That if the funding for the Nanotechnology Molecular Foundry does make it through Conference that a full, independent Environmental Report be carried out with public input and public review for the foundry and all other new development.

---oOo---

(ON THE RECORD, 7:10 PM)

MS. POWELL: If everyone would like to take their seats, we're ready to begin.

Actually, for most of this you can still look at the posters if you're interested, but I would like to welcome you tonight. My name is Terry Powell. I'm the Community Relations Officer.

Just some general information about the building and the meeting tonight. As you know, the bathrooms are out the door and to the right, both men and women's.

Our meeting is scheduled for two hours, because we didn't start right on time. We have salmon-colored comment cards for you. They're available with sign-in sheets and the handouts in the back of the room. We have a court reporter present now, and she will prepare a transcript of this meeting which will be then posted on the Lab's website when it becomes available. Other records of this or other meetings are not in the official Laboratory record. This meeting provides you with the opportunity to make comments on the long range development plan's EIR. Please give your full name for the record. You'll be given three minutes, so try to keep your comments or questions to that time. You may step forward to the microphone at the podium to make your comment. You may also write your comments on the salmon-colored cards, and give them to Beverly Harris or Ms. Stuart in the back or Angel Williams in the back of the room.

If there is time available after everyone has had a chance to speak, and you would like to make additional comments or questions, please do so. Responses to your comments will not be given tonight with some minor exceptions that Jeff will outline. Responses will be prepared in written form and placed in the record of the Environmental Impact Report. Please feel free to write your comments and hand them in tonight, or send them directly to the Laboratory.

A portable audio system is being used, so let us know if you cannot hear something. If you would like to receive future notices, please fill in the requested information in the sign-in sheet. The environmental documents for this project are and will be available on the Lab's website at www.LBL.gov/LRDP. They're also available in the Berkeley Public Library, second central -- second floor reference desk area.

For those of you who don't have the agenda, tonight we're briefly going to go through an overview and outline of the long range plan. Then, of course, most importantly, your comments.

Now I'd like to introduce Ally Benson, our Laboratory Deputy Director, who will give you a brief

overview.

MS. BENSON: Good evening. I'd like to welcome you all to the scoping meeting or the EIR, for the long range development plan. We're looking forward to your input, and appreciate that you took the time to come and give us your input this evening. So long range planning is critical to Berkeley Lab's ability to meet its mission. We need to provide a site that is satisfactory in terms of meeting all of those needs, and what I'd like to do -- probably -- I'd like to just briefly go over what our mission is because that really provides the context.

So the first of our missions are really to address the fundamental questions about the nature of the universe, what it's made up of, where did it begin, how did it begin, and how is it going to evolve over time.

The second major area of investigation is into an area of trying to develop solutions to some of the most pressing energy and environmental concerns facing the globe. Things like global climate change, things like environmental contamination.

We also have a mission to develop new materials that will improve the quality of life for everyone in the environment, and also for human health.

Finally, we have a mission -- a broad mission to ensure that the United States remains competitive with regard to scientific research in a whole spectrum of areas that underpins the economic health of this country.

So, this is our broad mandate. So the question is then, is what kind of attributes do we need to have at our site so that we can fulfill this mission?

The first of these is to create an environment to enable disciplinary research. What we mean by that is the research not where one individual works by themselves, but where teams of scientists covering a broad range of skill can come together to be -- so we need to create common places where people can come together to enjoy the time thinking about these challenging issues together.

We also need to create an environment and a place that can house national user facilities all over the world to one-of-a-kind unique kind of abilities where they can do their own individual research, but at facilities that are developed by the Department of Energy. Examples of these: National Energy Research Supercomputer Center, one of the largest non-classified computer centers in the world, things like the Joint Genome Institute -- all different kinds of forms of life and places like the Molecular Foundry, where people begin to design new kinds of materials and add them at the time with very special properties. So we also need to find a place -- create a place that's appealing to students and faculty, to create a good learning environment, that is an attractive

place and desirable place, where people come to be part of our environment and our staff. It's also very important for all of us to be good stewards of the environment, both the national environment that we live in, as well as good citizens and neighbors to our community. And finally, we want a place that welcomes and encourages knowledge and exchanges the technology transfer with industry and universities alike. So these are some of the attributes as we begin to think about the LRDP, that we want to create an environment that would achieve these goals.

So, I'd like to say a little about -- about how we go about carrying about our missions. I've talked a little bit about what it is, but I'll get a feel for the kind of science that we do.

I'll start with energy in the environment. Many of you may know that the environmental energy technologies division in the Laboratory is really leading the world in terms of new energy-efficient technologies. Examples include lighting, window coatings they have developed, appliance standards for many of the appliances. When you go to the store and buy a refrigerator, those energy requirements have been developed by scientists at our laboratory. So it's really made a huge impact, and billions of dollars of savings in energy alone. So this is a very important area.

We are also very interested in solving the climate change problem. There's a poster over there. There's some testimony that I provided looking at technologies that can mitigate CO2 emissions to the atmosphere and basically avoid ground water clean up, soil clean up, and so forth. So, that's one big area.

We also work in the area of bioscience and health. We have a large number of researchers trying to understand and develop techniques for preventing cancer, and they start with the very basic building blocks of life looking at genetic material, looking at proteins all the way through cells, and there's got the beginnings of an integrated program that allows us to unite at all these levels.

We're also working in the area of nanoscience. This is a comparatively new area. Material sciences in particular, are working to develop tailored materials that have just the perfect set of properties to deliver a particular function and Paul Acedo, the leader of that program, has also made some real advances -- solar cells as an example. They're also trying to develop much stronger materials. In particular, bones and so forth, is what can we learn from nature about these incredible materials that ever withstood the test of time.

There are also important issues that how could we store hydrogen. That would be a big bridge towards creating the hydrogen economy of the future. So, nanoscience nanotypes

are being studied to do this kind of thing.

At the heart of our science is really probing the fundamental nature of matter and energy. There have been very exciting discoveries in the past several years. The fact that the universe is mostly made up of dark energy, dark matter -- things that we can't see, but they know they exist. Because the earth is accelerating, and the universe is accelerating at an even greater pace. So, we have people who are working that will put a satellite up at Supernova, and understands use and understands this is the very beginning of the universe, and how it will evolve.

And finally, computing is a big part of the fabric of our laboratory. Simulation of very, very complex problems is cutting edge. Science has many, many areas, and the examples we're working on stimulation of global climate change. Combustion of fossil fuels and simulations for example, of groundwater contamination. So, these are the kind of science that we do now, and that we envision as being a very important part of your long-range development.

So, now coming back to the to the long-range development plan and the Environmental Impact Report, these really go hand-in-hand. The long-range development plan describes the physical attributes that would be needed to accomplish our mission and the Environmental Impact Report is a companion document that provides an opportunity for input to dialogue with your neighboring communities. It helps address how the Lab's development will act in accordance in our neighborhood community, and finally, it helps us bring environmental consideration into focus as we examine how to develop the site.

So with that, I'd like to move on to the main part of the program, today, but first, let me thank you again for your attendance tonight. I really appreciate it, and we look forward to hearing from you. Thank you.

So, I'd now like to introduce Rich McClure from our planning department, who will talk more about the long-range development plan.

MR. MC CLURE: I'm going to speak for a few minutes here about the long-range development plan. It will be a turn from 2004 to 2025. And there's the acronym, LRDP, and you see that around the room that what it means, long-range development plan. Our approach to the LRDP is to relate the science which is otherwise not related to the physical setting and to establish a framework for the physical development of the Laboratory through 2025, and our LRDP is being prepared concurrently with an EIR. The scope of the LRDP covers a few items that are not typically covered in the general plan or other thing. Let me run through what those are. We have a community and environmental setting. Land use development framework the design framework population and

space those are projection as you see in a moment. I'll go through each of these very quickly here. The community and environmental setting is a very important one to us. We've been working with members of the community for quite awhile, and we have a particular note here to the management program, the wildland fire risk reduce, and there are other factors here who does our stream programs and other things up here as well.

In land use, we're looking at three different land use designations on the site. One of them is the developed area, and that's areas where there are buildings, roads, parking lots, corridors and such.

The second one is vegetation and fire risk management areas, and there are a number of those around the site. Those have an additional attribute of being areas that they're not developing in, or it would be completely in some cases grasslands, but in addition to the trees and the other investigations on the main site, it's in the developed area -- there's this ring almost around the Lab there. And then we have areas that we will very much limit for management and in many ways entry, and these are areas, for instance, some -- there's one that has been identified as a potential habitat -- viable habitat for the Alameda whip snake on site. These are areas we're not really moving into. Another one is on the side of the north, Strawberry Creek along Chicken Creek, where we'll have areas we'll do minimal work, clean up the vegetation that is underscored on the exact perimeter of those roads, so that they will survive a wild land fire, but do relatively little in the area. The development framework -- and this one's really faded out, and I apologize. We're looking at a series of research clusters. Those of you which are familiar with the Laboratory know that we developed on the more or less as needed basis, so when an experiment came along they added a building or did something, and this is to get a sense of unity and cohesiveness across the main site.

At this time we're not in the position to demolish or to do major -- accomplish something that has a little more coherence. So, what we're looking at is how can we develop meaningful assemblies of buildings, and these are very much other natural settings that are -- each of these would have more or less a keystone building or a plaza or space that then draws people together in those areas and has a good relationship. So, we're moving towards another era of design up there that I think you will find much more favorable when you do see things. But again, we're going to be keeping that setting of the buildings innate is very much the dominant theme here, so you're not going to see whole buildings except in a few cases. One most recently coming forward, trees need to be planted in front of it -- is that's going to be happening. Then we 1ave a design framework, and I was talking

this is just kind of the -- in the advanced light source old town area as it goes into a common area, the cafeteria area, and such.

So, we' 5 looking at how do -- we create pathways that basically reflect there, so people can have interactions. How do we get people on single pathways characteristically, and have interactions that are very important for the science, and basically improve the overall character and the health of the groves in here? We planted many trees back in the early 60's, and they're planted much too closely together. We really need to be thinning those out. But the whole intent there is to get the healthier groves in here as well. Then we have a population and space. The population we currently have is approximately 4,300 average daily population, and that's calculated by taking 100 percent of the full-time employees up there at the Laboratories' team at the Lab, and 40 percent of the total number of guests that we have registered. You know, we have user facilities that draw users from across the world actually, and so, in our surveys, we found that typically you had at peak times -- 40 percent of them on site. So we put them on here as the figure to calculate that, and we project 5,500 again out at this, the 25-20 range.

amount of space, and we're keeping that constant as far as the communities of space, and the LRDP process as well as we're looking at having the draft LRDP out in February '04. The public comment period ends April '04. We're looking at the final long range development plan in late June-July of this next year available to the August timeframe within regents meeting to review it and improve it in August '04. And I think that takes us to your next part here.

MR. PHILLIBER: Hi, I'm Jeff Philliber. I'm the Environmental Planning Coordinator at the Lab, and I'm going to speak about -- I'm going to speak about the upcoming Environmental Impact Report that will be prepared for the project. I'm going to wait for my slide -- great.

The Environmental Impact Report that we will be preparing for this project, which is the LRDP, will be a programmatic one which replaces the 1987 Long Range Development Plan Environmental Impact Report as amended.

Many of you have followed your -- are familiar with that series of documents. It includes the '87 EIR, Supplemental EIR, and the addendum to that -- that was done in '97. The -- the programmatic document is intended to cover the entire breadth of our site geographically as well as the duration of the project, which, as you know, goes through 2025. The way that the programmatic document works, and in particular in this case, is as a future project comes about,

we'll first take a look at the project and see if it's in conformance consistent with the something that's envisioned in the framework of our long range plan EIR. If that's the case, then we move on and decide whether the impacts that would arise from the project have been covered in this document. If they're not, then we need to prepare a tiered document. A tiered document is usually an Environmental Impact Report or a Negative Declaration of a categorical exception under CEQA that incorporates any reference to the programmatic document. We would decide what level of programmatic document to prepare, and we would decide what issues need to be focused on, and also, focused out from that tiered document -- tiered document. These are the areas that we will look at the impacts of -- to these areas in our upcoming Environmental Impact Report.

We've focused on two areas here: Mineral resources, and agricultural resources, which don't really pertain to the Lab. We'll probably not concentrate on requisite resources too closely, and we will do a very comprehensive cumulative impact assessment in this document.

This -- this table didn't translate too well, but it shows the opportunities for public involvement in this process for the NOP. Of course, you can give us your written comments, as well as review the document itself.

The public scoping meeting, which is tonight, gives you a chance to give us written comments on comment cards, as well as to give us your spoken comments.

When the draft EIR comes out, you will be able to review that document and provide us with your written comments. We'll have a public hearing on the draft EIR, at which time in a forum very much like this one, you be able to give us your spoken as well as your written comments at the meeting. When the final EIR is issued, you'll be able to review the document to provide your written and spoken comments to the regents.

Our schedule is as follows: We're in the NOP period. The scoping meeting is tonight. The draft EIR is expected out in February of '04. We'll hold the public hearing probably in March. The final EIR is expected to come out probably in the July-August timeframe, and we'd like to go to the regents in August.

And that ends my slides. So, I'm going to turn it back to Terry. I will begin to take your comments.

MS. POWELL: Now starts our comment period, and we'd ask that you come up and speak at the podium. And L.A. Wood was here first -- and I know you have another meeting you have to go to, so if you'd like to start off, please do.

MR. WOOD: My name is L.A. Wood, Berkeley resident. Live within a mile of the Donner Lab part of LBNL. The commission, a few nights ago, made some recommendations

that we've submitted. I'm not going to belabor those, I just want to say something about the process tonight.

I think that the community is very grateful that LBNL would do a long range development. It's always so wonderful when one of the largest businesses in town comes forward and wants to talk to the community.

My problem is that often times, like tonight, we are offered up LBNL with the wonderful world of science with all the posters, and when most of us recognize that that's not the issue tonight. It shouldn't be the issue tonight. Tonight the issue should be the development of the hill, and some of the activities that are going to go on up there. I think that the hill represents a -- a huge resource that I think that the lab is -- 'cause you think you call it the "neighborhood communities" as you referred to us -- is that we're not really being considered. It's that equation I don't believe with the development.

Right now, apparently, you have 25 percent of the hill that's already -- that's a serious problem when you propose projects of the area -- the deficit that you are talking about that administers development modes more imperious surface when -- you know -- in business, it's better to consolidate yourself.

I also want to say something about the watershed. The watershed up there is very, very important to Berkeley. We on the commission have tried to get the city to clean up the watershed and be sensitive to it, and recognize that the development destroys watershed. There's no way that you can put the kind of development that you want, a million square feet on the hill and not absolutely destroy that -- the environmental -- the environment of the hill, and the resources of the community. We're not talking about this is a resource that has been in Berkeley that Berkleans have been able to use for some time, and I think that what you're creating long term is something that's not very desirable for the community at all.

As I said, I just don't think you may be studying some of the science of the hill. But even though some of us have problems, you should know that we know now that -- things -- we do weapons work, and you know, we're very concerned about that. Weapons-related type work. We know in the future that's going to be more the case then it is told, and those are very serious concerns to us.

And I just want to say that -- that one last comment that with regard to the Lab. I think that maybe the one thing the Lab doesn't realize is that we're not against its science, we just think it didn't respect the fact that it is in a local area urban area, and many of the science that they want to pursue are important to pursue, but are detrimental to the air quality, and to the environment of Berkeley.

And I need to be done. Someone else like to come up and speak?

MR. SHARP: I'm Jim Sharp. I've been a 35-year resident of Berkeley, and I'm ready to buy one of these photos, because I think it's one of the best things the Lab has produced that I've seen.

Let me just point out that the first time I saw the Long Range Development Plan come by -- was it three years ago? October 2000 -- and I haven't heard tonight why there is a three-year hiatus. Nevertheless, I spent a lot of time at the University, studying what was called city planning in those days -- city regional planning. And one of the things we were taught was that planning is really thought before action. But what we've seen recently in the last less than twelve months is sort of action before thought.

I think it was on December 10th last year that I first learned about the Molecular Foundry. A Notice of Preparation came out, and everything proceeded very rapidly after that. And the regents finally approved the foundry. I think it was early March -- I don't remember exactly. And along came Building 49 which is one of total out source. Building 49 -- which is kind of amazing if you can outsource a building on campus you can imagine the implication of every building was owned and operated by an outside contractor. The -- when that first came out, we were going -- the Lab was going to cover a riparian corridor with a parking lot. Well, they backed off on that around July. But I -- you know in just the last less than a year, I've been surprised at -- at the way the people that are running the Lab are -- are -- you know -- rolling these projects again without planning. It seems to be the actions preceding the thought.

Okay. I do know -- and again, some of the people here aren't very actively involved in this, and I appreciate the efforts to get the word out. But I see some of the -- what masquerades as thought or whatever is -- is really public relations. And the one that got my attention just in the last -- in the last week, was something again for the Molecular Foundry. It's called "Nano-High." This is for high school students. Now okay, that's great. Let's let high school students learn about nanotechnology, and so on. But it's starting this Saturday, and you can take a class -- if you're a high school student, I mean. It's a one-day, or part of the day November 22nd. So, anyway, I'm saying let's get things turned around. Let's focus on the watershed. That's what we got here, and I'd like to see the Lab join forces with the University and the UC, and focus on the whole watershed and stop artificial planning as it were. Thank you.

MR. KELLY: Hi, my name is Michael Kelly, and I live on Panoramic Hill. First, I'd like to just say a little bit about what I hope the long range planning process might mean

to LBNL. Having spent a little bit of time on the work group, I know that there's two different ways that you can -- two different main attacks that deal with ceasing exposure intake. One, is that you can start with a young product you want to do a project you want to have your figures meet certain regulatory standards so you can work backwards is try the work around the problems that come up. Another way to look at ceasing health impacts and to actually look at health impacts. And the way we're really looking for problems. I will hope that at least intelligently within LBNL, this process can be a contemplative process in which you're actually looking for problems, and not just looking or avoiding bottom lines that are going to give you problems in your plan.

Having said that, I'd like to speak just for the moment on a different issue which is, traffic. The traffic corridor is south of Berkeley -- south side of Berkeley, Clairmont, Piedmont are constantly saturated during peak hours. I know there's a large session in the LRDP that can look at traffic issues. What I see not just from LBL, but from LBL, the City of Berkeley, and also the University is three institutions that try to take traffic seriously, but in the end, we've got an ever increasing problem, and to a certain extent, I think all those institutions have their heads in the sand about that. Because probably no matter how much you try to put in little programs that make things better in the end, this expansion is going to create extra parking spaces for extra cars along those corridors, and we're at the point now where people in the Lab have to drive through that. Think about what would happen when those corridors are fully saturated -- say 5:15 to the point where you can't even get off to the side because people are sort of stuck in all the spots in intersections where you should be able to turn, but you can't because people are just filling up all the space. What if a major fire starts on Panoramic Hill at that point? What does that do to emergency response? And this isn't just about emergency response.

Traffic is also a quality of life issue for all the people on those roads, and for the people that live around them. But I think particularly concern needs to also be placed on the saturation of those traffic corridors because they sit right on top of the Hayward Fault. They sit right adjacent to high fire danger areas, and it's increased risk. I mean, we saw the major earthquake that happened here and down in Santa Cruz happen at rush hour. Two major events that happened at the same time. Thank you.

MR. METSPHER: Good evening, my name is Ian Metspher. I'm here basically, to talk about transportation and traffic issues. Some of you know that I'm on the Transportation Commission in Berkeley, as well as an active member of Encina, which is the neighborhood on the south side

of Berkeley. But I'd like to speak about what you plan to do with the transportation element of this thing, because there are ways that we can help ourselves.

One of the first ones I'd like to see you do is consider an Ecopass for all of our employees. That should be done so you can encourage people to get out of their cars and make it worthwhile to get out of their cars. If you're going to add another 1,200 people to the Lab, we've got to get them on buses or public transportation of some kind or another.

The other thing is the corridor. The corridor at that time rated during rush hour, both morning and afternoon -- the only way I want the Lab to get very much involved in working with the city is to get carpooling lanes, or dedicated lanes, or buses during rush hour on our major buses to encourage people to ride on them. It's the only way you're going to get people to ride the bus. Get them on schedule and you can help.

So, what I want to see in the EIR is the budget items that produces money. To AC Transit to begin to help solve some of their problems which will make you better neighbors with us. Thank you.

MR. KELLY: Good evening. My name is Tom Kelly. I'm a resident of Berkeley, and also a member of the city's community health commission.

I'm just kind of curious -- you know -- if anyone here could -- would just raise their hands if they know what nanotechnology is? Everybody knows. That's great, because I have no idea what it is, and I've been reading about it for quite awhile. But the reason I bring it up is the City of Berkeley recently passed a resolution that requires the city to consider the implementation of the precautionary principle in all of its activity. It's going to go big. Sort of a review. And the idea is to try to minimize the harm that its activity is to its workers, and its citizens. And they're doing that even though they don't have complete scientific proof of the chemical or something that they're using is harmful to human health. And -- you know -- one of the reasons I think people that are starting to look at our environment like that is because we realize -- and I can say this because I also work in the Health Department where we look at the environmental causes of non-infectious diseases like asthma and autism, and cancers -- that there is so much in your environment that's having an impact on the health and we can't nail down the specific element that is causing that.

Cancer is increasing. Take respiratory disease, but we know that there's something going on, so rather than try to prove it, the precautionary principle would encourage us to step back, let the prominent something show that it doesn't have a harmful effect on the environment, and then introduce it, or offer it you.

The city of San Francisco has adopted the principle in all of its purchasing activity, because it's coming to the conclusion that it's a smarter way to go than the way they have been doing it in the past.

The union recently adopted the policy, which requires the manufacturer of the chemical to show that it's not harmful to human health before it can be introduced into the environment. It's revolutionary, because they've realized that they don't have any more proof than we do that something is harmful. They produce two or three new chemicals a year. They have no idea what it does. They don't know how it works. But we do know different types of cancers are increasing that are all fairly certain. So, just to show you that this isn't just San Francisco or Berkeley that's concerned, the U.S. Environmental Protection Agency understands a not very environmentally friendly president has issued a request for proposals that ask to look at the health effects of human health. And they say there's a serious lack of information about human health and environmental implications manufactured nanomaterials, nanoparticles, nanotubes to nanoscale materials. Potential harmful effects of nanotechnology might become aware as the appointment of the nature of the nanoparticles themselves is characteristic of the products made from them. The aspect of the manufacturing process, the large surface area crisline structure, retroactive of some of the nanoparticles may facilitate harm because of their insinuation of cellular material. Not even the EPA knows what impacts these things have, and yet we're preparing to let them loose in the City of Berkeley.

I think at least we should be asking for a discussion, and the people that may be impacted by these things right here in Berkeley, before we start signing off to allow something like that to be constructed in our community. Thank you.

MS. WAGLEY: Good evening. My name is Ann Wagley, and I'm a resident of Berkeley. And I'm not going to repeat the serious concerns of neighbors and environmentalists, and things that have already been said. Instead, I'm going to talk about money. It's interesting that Lawrence Berkeley Lab is envisioning its long range development as a hill town cluster. That is on page 10 of your NOP. Sounds very nice. And I'm sure it will be in this case for the people that work there.

Unfortunately, it costs a lot of money to run a town -- City of Berkeley knows this all too well. We are currently facing a severe deficit, and it's expected to grow thanks to the governor who was inaugurated today.

The City of Berkeley has to provide safe access roads to the Lab, street lighting for when you come and go from your hill down to the dark, sewer services for every

toilet and sink in your town cluster if a fire emergency happens. And the last is really serious, because we know the concentration of hazardous material at LBNL. These serving for you are paid for by the most part through property taxes paid for through us who live in this -- the town of Berkeley.

Currently the rate is 1.27 percent of increased value is one of the highest in the state of California, and we also pay a significant amount of money in the form of assessments, based on the square footage of your home.

I would like to suggest that the hill towns for the Lawrence Berkeley Lab levy on themselves similar taxes and assessments to pay them the city hall that provides the service that you use. These are commonly called pilot fees, or payments in lieu of taxes, and they are paid by governmental and institutional tax exempt entities to the host municipality, and that's done across the United States.

I strongly encourage LBNL to work with the City of Berkeley to find appropriate levels of payment for services both for current service to the infrastructure impacts, and also for those that are appropriate to the LRDP. We need to be fair here, and the hill towns or Lawrence Berkeley Lab need to pay their fair share. Thank you.

MR. SHIVELY: Good evening. I'm John Shively. I'm a Registered Professional Engineer.

I wish to speak in opposition to the siting of the proposed nanotechnology research facility in the Berkeley hills adjacent to and above the densely populated urban area.

My opposition is based on the problematic location, and not on the nature of the research work. The critical questions of research pertain to the important issues such as variable toxicity, contained problems, unintentional releases, substance propagation, dilution feasibility, biodegration feasibility, irreversible contamination recovery potential, and of particular interest to me is research site location. Because this is a relatively new field of science, many of the questions are not yet answered. However, site location is one we can address.

Although there are many unknowns of the -- about the conduct of nanotechnology research, one variable is to control where it can be done safely. That shall not be in the hillside above a densely populated area. There are many other potential sites in California that can be used that would pose a far less danger to population and the environment.

Nuclear weapons research originally conducted at the Berkeley Lab had a different kind of containment problem. A containment problem of a different sort. That containment of classified weapons information. And in the 1950's the weapons work was relocated entirely out of the Berkeley Lab and moved to the Navy Air Station on the eastern end of the Livermore

Valley.

When I worked at the campus, we learned that the source of the problem is Strawberry Creek. Water migrates westward from the hills towards the bay from the watershed above in and around the Lab out of streams, creeks, and trails. Much of this water comes from the Lab down Strawberry Creek under the stadium and through the city in route to the bay. Any accidental toxic release from there could eventually end up in Strawberry Creek and in the city's environment. This would be a genie that could not be put back in the bottle.

Let's not put the genie's bottle in the Berkeley hills. Thank you.

MR. MILLER: My name is Lowell Miller. I used to work at the University S.F. California in some context with the Lawrence Berkeley Laboratories. I will have the following suggestions for your evaluation. Regarding population, first of all, I think there should be an evaluation of the staff that's working at the Laboratory to see which -- if some of them can be moved at all. That is people that are not essential to the mission of the Laboratories and undertake things like either located off campus or telecommute. And in that sense, the second in succession followed would require management training of the senior staff all the way from the present downward, with regard to this telecommuting opportunity, since there is a general sense of distrust that the people who might be working from home might be goofing off. This would help, I think, reduce some of the transportation problems. Thirdly, all other functions that are not essential to the Laboratory's science of emission, like perhaps printing functions, things that could be outsourced, should be thought to move off campus so you can reduce the possible space, and perhaps to reduce the quantity of the space you would need. And fourthly, that is sort of the whole suggestion perhaps, there should be some sort of aerial tramway or some sort or transportation that's done to use to transport people from the location from the campus or whatever else, so they don't have to rely on businesses which are kind of the old technology. This may be sort of interesting. I think if those can be considered in the report, it might help reduce some of the other issues. Thank you.

MS. BERNARDI: I'm Jean Bernardi with the committee. I'm also a member of the Panoramic Hill Association. The Notice of Preparation for the Draft Environmental Impact Report for the Lab's long-range development will analyze the expected annual average construction rather than doing an Environmental Impact Report for each discrete project as it comes up in the future.

This is evasive and not acceptable. An EIR/EIS

must be done for each and every project proposed to be constructed landslide critical, fire season. This is the Strawberry Creek watershed. It's bad enough to work on the LRDP which was postponed for three years. So that too huge projects at Molecular Foundry would not be evaluated. The context of the long-range development plan where cumulative impacts could be thoroughly assessed. The Molecular Foundry must be postponed and evaluated under the LRDP as Tom Kelly has very well stated about POG principle. The City of Berkeley has adopted it, and do you respect to the residents of Berkeley and Oakland and it's employees?

The Lab should also apply the reductionary principle in determining what project should or should not be undertaken by the Lab. And therefore, every project that needs precautionary principle applied it as the LAN biosafety to Molecular Foundry devoted the nanotechnology. As I say, Tom Kelly covered that quite well. So, I'll jump over some things I was going to say -- and there are numerous experts and groups who have warned against rushing head long into nanoresearch. For instance, the ETC Group in Indiana dedicated the economic diversity government to adopt a moratorium on nanomaterials being produced in laboratories without testing for health and environmental impacts. The director of the center for nanotechnology at Rice University, Dr. Vicki Colvin, when interviewed in April this year, stated, "I'm anxious about when the first paper on health effects of nanomaterials publishes."

Mike Crow reported in February 2001, that all the mice in their experiment died, including those who had been immunized. This experiment was intended to sterilize the mice with mouse pox. That means the virus they created was on the loose, which is an immunization that does not exist.

Another concern at the Lab is the proposed proximity to the human geoinstitute is possible -- modified a little for which the health effects are unknown, and for which the Centers for Disease Control offers no guidance, which there are no known cures. Is that just a warning, or do I have more time? I'll finish later. Thank you.

MS. THOMAS: Good evening. My name is Janice Thomas, and I live in Strawberry Canyon.

I want to take this opportunity to not only address LBNL but also UC Berkeley Jennifer Lears is here. She took off. She left. Okay. And also the City of Berkeley -- I saw Grace McGuire back there, and anyone -- goodness, we're well represented -- and so I see areas of improvement in terms of strategic coordination between the City of Berkeley, but last year was such a terrible year for community people in terms of our -- all the projects that came around, and how blind sided we all felt, that personally, I'm still recovering, and I barely had so many feelings about it.

But I want to take this opportunity to try to be constructive about all this. For example, the watershed management plan. Before the meeting, I was talking with -- giving me more detail to some of the questions I had, and Pamela, and he mentioned there was 1,200 acres of the Strawberry Canyon wherein LBL can't really do a watershed management plan.

Well, I want to ask for the city of Berkeley to ask LBL and UC Berkeley -- since it's all UC land -- to come up with a watershed management plan. That's -- let's do that.

Another thing that is joint coordination. Rim Road, Centennial road, I don't know. Is that UC Berkeley Road? Or is that an LBL Road? But I can tell you that this additional population is going to have an impact mitigation, or is it going to be LBL's mitigation? Because I can tell you at the entrance to Panoramic Way, we're already experiencing really treacherous pedestrian conditions, because people get in and out of their cars there.

The third problem. There was a DTSV meeting the other night. I didn't see anyone from UC Berkeley at the meeting, and there really should have been, because one of the opportunities states the UC Berkeley LRDM and the DT was contaminated. And again, I'm a layperson that there is -- you know -- any way there should be again, joint discussions, and I hope community-wide discussions, and not behind closed doors. Although that's better than no conversation between the different academies, but still it's better, and joined to include the public. And then, finally -- well not finally -- I really have quite a long list -- the water upgrade projects, that's in the East canyon, that was a great opportunity that LBL just completely missed, where in fact the Panoramic Hill neighborhood that really suffers from lack of water. Literally, we do not have high grounds. That upper part of that hill should have -- that could have been an opportunity to provide water to this neighborhood.

The -- that's something that again, working with City of Oakland, the City of Berkeley you made your neighborhood much safer. So, thank you.

MS. CHACOS: Good evening I'm Ariatta Chacos with the City of Berkeley City Manager's Office, and I just wanted to say on behalf of my colleagues and myself, we have a number of us here taking notes trying to monitor what's going on with this. We're working on every opportunity we can to coordinate your operation and information, sharing both with this LRD and the UC Berkeley LRDP. And tomorrow night, the city council will be discussing this item with the LRDP for the Berkeley Lab. We encourage people to come in, listen to what the City Council has to say, and feel free to route any information request or comments you may have to our office, as well. Thank you.

MS. SEVALA: Good evening. My name is Pamela Sevala with the Committee to Minimize Toxic Waste, and I wanted to sort of follow up on the sentiment of Ms. Benson. There is another more sinister side to the Laboratories which is known to Berkeley citizens through newspaper articles. For instance, the San Francisco Chronicle article headlines "Berkeley Lab Found Research Fabricated-Scientist Accused of Misconduct Fired." Lab says -- date of -- again, the Berkeley Voice. This is October 3rd. "LBNL finds accounting to be sloppy. Lab scientist quits after investigation he transferred $3 million to accounts that he was not -- nobody knew about -- and also there is an audit going on regarding UC audit reveals many unbalanced accounts." And so these are very disconcerting issues. I think there should be a full comprehensive audit of the Laboratory. Not only of the fines, but also of the environmental conduct of the past 60 years. We have followed the problem for the past seven years. The final -- the Triton emissions have stopped, but the clean up -- there has been no treatment to the comprehensive clean up, and there seems to be real reluctance on the part of the Laboratory, although Ally Benson said we work on cleaning soil, contaminated soil, contaminated groundwater -- why not clean up your own site? Why don't you start there? Clean it up. Make it absolutely pristine as it was in 1940. And then, only then, start planning on building new hill towns on the site.

The Notice of Preparation, page 8, indicated that there are plans to increase the laboratory space by 1.2 million square feet. If you divide that by the square footage of Building 49, for instance, that would mean that there would be 18 buildings the size of Building 49 built at the Laboratory. I mean, this is a huge complex. Six story laboratory office buildings, and -- and I notice here none of these presentation materials indicated any kind of planning for the site. There was no specific land use maps, and I thought that was the reason why we were here to discuss specifically where these 18 to 19 buildings are going to go. And -- but there's no information, so I would like to suggest that the EIR have various maps that will show in detail where these buildings are proposed and their relationship to all of the major fault lines to the creeks to the springs, to the for -- to the landslide carries so that you can get a comprehensive picture of the site, as well as the areas of contamination. I think we need now after 60 years of operation -- I think we need a comprehensive analysis of the site and environmental audit as part of the LRDP EIR. Thank you.

MS. RAY: Good evening. My name the Lauren Ray. I'm an Independent Scientist. I worked five years at the Lawrence Berkeley Lab, and two years at the Lawrence Livermore

Lab, and three years ago I went to Hiroshima and Nagasaki, and saw the truth about what the University of California and the nuclear weapons labs have done to the health of the public globally, and to the health of the environment globally. And because of that experience I work now around the world on radiation issues. I'm also on the environmental economics counsel, and I'd just like to point out that in 2002 the global funding from government is around the world for nanotechnology was $1.5 billion. In 2003, the nanotechnology funding initiative for the United States was $700 million, and $500,000 was awarded for environmental impact studies. So you cannot tell me tonight or this year or next year that the Lawrence Berkeley Lab has any idea whatsoever what the environmental impact will be because you don't from the nanotechnology and I worked internationally with scientists around the world I just attended a conference in Florida on the health of the environment therefore organized by Russian scientists because Russia is a sick old man from radiation poisoning. 18 percent of the children in Russia are born mentally retarded because of the radiation and chemical pollution from their nuclear weapons and there you can clear power pollutions. Our health can be no better than the health of the environment -- we breathe the air. We drank this water. We eat the food from the soil -- that is part of your environment. And 1 out of 12 children today in the United

States have learning disabilities. What is that cause to our society? The nanotechnology -- I'd just like to talk about nanopathology. This is the laboratory in Italy. I just attended a conference on depleted urbanism deep in Afghanistan in Iraq. A scientist from Italy came and talked about nanopathologies ongoing to continue talking in the second part, because I would like to talk about that.

MR. CUNNINGHAM: My name is Jim Cunningham. I'm a resident of Berkeley and I have worked with the committee to minimize toxic waste. I usually don't talk about the science aspect of these issues, because I'm not a scientist, but I read the article -- this in the Chronicle -- on the Yucca Mountain Depository, and what amazed me about it was what the two groups of scientists were saying -- not a group of scientists -- and a group of nine scientists were saying it has been discovered that there are things that will happen in that depository which had not been known.

The second group of scientists are saying, number one, how can this research have been going on for as long as it has been, and you haven't known this? And the first group said, "Well, that's true." However, that means that the deposits are going to go into -- into the earth slower. The second group of scientists are saying that may be true, however, what else is going to happen that you don't know about? You didn't know about this. There is no reason to go ahead and use that

depository because there -- it is obvious to the second group of scientists that there are things that are going to go on there, and you don't even know what can go on. Immediately I thought of the Molecular Foundry because it's way out of line. I'm not a scientist, but I don't want that to be built until I have two groups of scientists sitting here in the room saying "yes" and saying "no." That's what I want to hear, and I don't want that building to be built until that information has been given to me and to the public. Thank you.

MS. CHACOS: Ms. Ariatta Chacos, City of Berkeley. I forgot to mention when I spoke before, that the city has made a formal request to the Lab to extend the comments for the NOP for the 14-day period, and that would put us somewhere around the 10th of December, absent the Thanksgiving holiday. So, it might be a few days after that.

We have heard back from the Lab saying that wasn't going to be possible. We are still going to keep calling and saying things at meetings and whatnot, that we would love to have another two weeks both for the city and for the community to weigh in on sort of the cumulative impasse, both of the Lab's long range -- with the UC Berkeley long-range development plan, so we would like just a little more time to think about this and respond more appropriately. Thank you.

MS. POWELL: Are there others who would like to speak? I know there were some people who had some additional things to say.

MS. BERNARDI: I just had a couple more paragraphs that I didn't finish.

MS. POWELL: Can I give you another three minutes? Is that okay?

MS. BERNARDI: I'm not sure I'll use it. So in regard to the Molecular Foundry by the nanotechnology Tri-Valley Cares, and Citizens Against the Radioactive Environment. In their newsletter, "Citizenwatch" have an article titled, "Bugs the Bombs." And that stated that the Department of Energy local neighbor security program has grown 115 percent to 87 million, since 9/11, and that this budget has been transferred to the Department of Homeland Security. Homeland security projects are planned for the Molecular Foundry. No classified research is done at the Lawrence Berkeley Lab. We wish to have a detailed description of all Homeland Security projected, the experiment proposed to take place in the Molecular Foundry.

The Department of Energy designs weapons for the Department of -- so-called -- Defense. I think it's more the Department of War these days. What we need elaborated in the long range development plan is how the Berkeley Lab's Molecular Foundry fits into an overall Department of Energy program for nanotechnology.

Shawn Howard, in his article, "Nanotechnology and

Mass Destruction. The Need for the Inner Space Treaty." This article is in the July-August Disarmament Diplomacy. I guess it's a journal that warns of the dangers of new types of weapons of mass destruction emerging from the development of nanotechnology. I think that that's a concern that we have because we know that the Lawrence Berkeley Lab, although it's said over and over, they're not doing any weapons research, that's not true, because they were involved with the Dart project, which was making something at Las Alamos. I think it was for simulated nuclear bomb attempts. And the defense part of the contract with UC has increased in the budget, so these are definitely concerns that we have, particularly when -- when -- think about the facts that the Molecular Foundry is going to be a user facility, and it's really hard to imagine how you would ever adequately provide oversight for all of the things that might take place in the Molecular Foundry.

As I was saying, this is a laboratory in Italy using nanopathologies, and -- I just think that if they're concerned in Europe with nanopathology that we should be too, and I have haven't heard any mention from the Lab about the actual environmental impact or health impact of that technology. I've heard nothing but that it will ever have any impact, and clearly from the funding that's been allotted for Environmental impact research, there's been none done.

I know that in a study on rats that were exposed to nanoparticles, half of them died immediately after exposure, being injected with nanoparticles. Their tubes were just completely plugged up. And on -- I am also very concerned by the interaction of nanoparticles with radiation and just exactly how the Lab proposes to do nanotechnology in a radioactive environment.

The Bay Area, especially Berkeley, is extremely polluted with radiation. You cannot do nanotechnology in a radioactive environment because the radioactive particles damage the atoms which are the building blocks for nanotechnology.

In May, Pamela Sevala and I attended Drexler -- who is the father of nanotechnology -- conference in Palo Alto, and the hazards of radiation and the need to do this. A radioactive-free environment was discussed. I actually became the citizens' scientist, the whistle blower at Livermore in 1991. Plus, I was working on the Yucca Mountain project, and the extent of the science fraud in the most important public project -- public works project in U.S. history, which is what to do with all of the radioactive waste is why I walked out one day and became a whistle blower. And I'm telling you that is in the most active region in the United States. It is built in a volcanic region of water under that repository -- the hot springs -- which indicates volcanic activity, and it's just the last stop for the trash from the nuclear weapons in

the nuclear power projects. And we will find down the road that genetically modified organisms in food and nanotechnology will be part of a similar pattern of science. So, I don't think that the Lab knows enough about nanotechnology to undertake this project.

This is a parliament report on low level radiation. It was released in January. I've been all over the world with this report, and just the nuclear -- the -- the nuclear power programs long have been, or will be responsible for the death of 60 million people globally -- 2 million babies, and 1,600,000 unborn babies.

I think we need to remember the precautionary principle now more than ever. Thank you.

MS. THOMAS: Janice Thomas. In the comment by Sally Benson -- where is she? You mentioned the context -- the mission. And one of these was to address the fundamental nature of the universe and to house national user facilities. And these are all very important. I agree with you. But I would hope too, that this long range development plan really speaks to what this DOE laboratory can give back to the local community. And by that, I don't mean just science fairs, and "Nano High," and open house days, but I mean really what can this lab give back to the community?

Certainly my -- one of my concerns is that this canyon be preserved to a greater extent as the natural environment. And when I say greater extent, greater extent than what has been currently contested by LBL and UC Berkeley.

But I also think that there's an opportunity here for again, UC Berkeley and LBL to look at the health effects of this. That these labs research has had on the neighboring community. This has been going on for decades, and we do have a Department of Public Health in at UC Berkeley, and certainly, I can promise you that if this lab doesn't take this initiative, that myself and many other people will begin to start lobbying very heavily, and hopefully effectively, to get the UC regents to take greater responsibility for the health effects. I just don't mean a simple risk assessment that looks at cancer. I'm talking environmental medicine.

There's a genome institute at the Lab. I would love to have my DNA looked at. I would love to have Mike Conway, and -- really look at these things for the local community.

You know, I know people who have grown up in the hill. I know myself just there 17 years, I don't know if my joint ailments are environmentally related or not, but I essentially would like there to be that kind of stewardship. And for this laboratory to take it as the submission to give back in a real substantive way, and to make itself part of this community, because I think everyone of us believes the science. I mean, really. And it's the management that is concerning. It's the management and administration. That's

something that I believe all good people in good faith can work towards. I know you shall.

MS. SHIMMERLING: I'm Carol Shimmerling, and I am with the Earthquake Council. We are very concerned about the way the Lab has managed the creeks on their facility, and the way they intend to manage it if they're going to have as much development as they say they're going to have. We're very interested in doing work in the East bay, in particular, that we hope will spread around the state as a state-wide organization. We are doing surveys of the upper watershed, the original streams that feed into the streams that go into the bay. These lead water streams are greatly important to the health of the whole system, and when they are damaged, and when they're polluted -- the whole system is there in an urban environment. There's no way that this can be cleaned up when so much of the water goes through culverts, concrete channels, and other none biologically-sound environments.

So, this is a great concern for us. But now as a citizen, I have to say that it was a horrible mistake that anybody ever built that Lab in the first place on these hills. And now that they're there, there's no real reason to continue to make it grow. It's time to start downsizing, and particularly in the light of some of the problems that people have already mentioned about the way the Lab is being run, and its representation amongst their peers, elsewhere. It's time, in fact too, that the Lab stop doing research and having user facilities, and it's time that went back to the original theoretical work that they ostensibly were supposed to be doing. If that doesn't happen, none of the measures that you claimed you will take, will really make much difference in preventing accidents, both health and safety. Nowhere have you mentioned what you're going to do with the growth of eucalyptus trees that's filled with . You haven't said anything about pollutants in Chicken Creek. None of the things that are really problems that you have created have been mentioned. I find it astonishing. I mean, it's like listening to Bush and Cheney. Everything's fine, folks. Don't worry about a thing. We're all going to take care of it. Just give us all your money.

So, I don't believe that you know what you're doing, quite frankly. I'm sorry to say this. You're all nice people. But we all make mistakes. We're human. And in fact, I don't believe that you have any idea of what the consequences are of your 20-year program, and I think the consequences are not going to be beneficial to either the people that live here or the environment.

MS. SEVALA: I just -- well, a question just to follow-up on Carol. It isn't meant -- I think she is very very right. And I have another newspaper article from the Berkeley Voice, July 19 2002, which is related to the fact

that the Department of Energy did not renew the contract with the UC to manage the Lawrence Berkeley Laboratory. And I would like to find out what the update is. Is there a contract currently for the management of the Lab? Did the Department of Energy provide a new contract? And basically, the reasons why the Department of Energy had not made a decision, at least as far as I know, as of today, unless you tell me otherwise. Is the fact that at the highest level of management they're considering whether to extend or compete, so it would be important for the community to understand what is the status of the laboratory's contract? And indeed, if the Department of Energy is not going to be renewing it, what will be the future of the laboratory? And what is the relevance of all that to this process tonight? Thank you.

MR. KELLY: I wasn't going to say anything else, but Carol Simmerling got me all worked up. I brought a couple of things in mind. You know, in one thing I just wanted to sort of caution us about is first of all, I don't think that everything that these folks that study nanotechnology are interested in are all bad. There probably are some good things that might one day come out of it, but it would be -- might have that conversation with all of us. But one of the things that I notice is that the proponents of nanotechnology make arguments like, this will revolutionize or aid to bring medicines to all the poor of the world. That we will be able to clean the water everywhere. That we'll -- and it just goes on and on. There are all these social benefits that they use in order to sell us on this idea that nanotechnology is a good thing. And I hear the good folks here from the lab saying -- and that they -- you know -- one of their parts of their mission is to improve human health in the environment, that kind of thing. But there's always that element in there about fueling as well, and that is the thing that I want to warn us about, is that unless these things have some economic benefit to someone, they're not going to be distributed, and how do we know that? The pharmaceutical companies thoroughly refuse to distribute in places where people are dying by the millions, and why? Because they can't get enough money for them.

We can talk about the automobile industry. One of the benefits of the nanotechnology will be to make things smaller, more efficient and everything. But automobile manufacturers won't make their cars fuel efficient. They have the technology, but they fight these standards tooth and nail. They haven't changed since, I think, 1982. So, with all the SUV's we're selling, the average fuel economy is going down for cars.

I just put that out there that when you try to explain to us that the world is going to be a far better place after of this, you might want the take that with a grain of

salt. That's it. Thank you.

MS. STOUFFER: Molly Stouffer. I work at Lawrence Berkeley Lab. But I'm not here to talk on behalf of my employer. I just wanted to share a few of my own thoughts and my own views about this. Can you hear me now? Anyhow, my name is Molly Stouffer. I work for Lawrence Berkeley National Lab. I'm not a scientist. I can't speak to any of your scientific concerns, except perhaps that I do work for one of those neighborly user facilities I think do -- do fundamental research about the nature of the universe and about those fundamental concerns that the laboratory's done its research, what 60-odd years ago. That research is still done. That is still the purpose of the laboratory as Dr. Dennison said, and that is what those user facilities are -- you know -- there for. People not just from our community, but from anywhere in the world do research at these. I would hope in the laboratory's long range development plan that they do address and maybe plan to mitigate traffic concerns. The corridor along Panoramic Way is saturated. And as good neighbors we need to -- we need to do something about that. We need to mitigate that. The watershed is an important thing and I hope, again, that the laboratory makes whatever efforts to -- to be a responsible steward at the watershed. And to -- to place a high value on that. That's not a -- a resource that could be rebuilt or that could be recreated. But I have faith in the people that I work with, and that I know them, and I have faith that they are responsible stewards, and I hope that they will work with the community on these issues, because I hope that the science and the achievement that I value in the place -- you know -- are something that can be important enough to the community, and that we can give back to the community and really, really research out and really do something of substance for them, too.

MS. SURNEY: My name is Susan Surnay, and my husband is a Research Scientist at the Lab, and Professor of Nuclear Chemistry on the campus.

The lab was unfortunately placed on the hill to begin with, and I think at some point, like with the campus, there's got to be some off-loading from the hill. I mean -- I don't want to repeat myself.

My name is Susan Surney. My husband is a Research Scientist at the Lab, and has been for 40 years, I think. And is a Chemistry Professor. And he's a Nuclear Chemist.

I'm also a preservationist, as maybe some of you know. I -- the Lab is in an unfortunate location to begin with. It should never have been built there. And too, because it's on a hillside and a watershed -- but it is there. But it doesn't have to keep growing. It just simply doesn't have to. That doesn't mean that the research has to stop. It just means that it needs to be off loaded somewhere else.

Because you just can't keep building up there. And the juxtaposition of the campus and its needs and the LBL, and it's needs are too much for the downsizing environment. And I think that serious consideration should be made of alternative sites. There is the Richmond Field Station, which somehow the University and LBL don't want to go out there too much. But at -- and the thing about the Professor and the grad students, and the research, and the sharing of -- you know -- the two entities is actually not as great as it had been in the past. And so I think some of it should be put offsite. Thank you.

MS. POWELL: Are there any other comments? Janice Thomas.

MS. THOMAS: Janice Thomas, again. I just hope that this document somehow addresses why this site shouldn't be used for housing for UC Berkeley students. I've said this before, but again if we take the UC focus instead of UC Berkeley and LBL -- to me, the question needs to be answered as to why the research can't be done more offsite, and what was peculiar -- or particular about this location that mandates that this research should continue at the site, when in fact, I think a very logical argument can be made that approximate housing for UC students would be of greater value.

MS. MORGAN: My name is Sara Morgan, and I work at the Lab. And I just wanted to kind of bring to the table that not only does the Lab have a responsibility to the community, but the community has a responsibility to the Lab.

A large portion of the population of the Lab are community participants. They either live in the nearby communities, or drive through the communities. They contribute to the communities in some fashion or another. And as a result, it's not that the Lab needs to give, give, give, and the community does not also participate in the conversation in that. We provide emergency service to the communities. We provide jobs. We provide tax -- well, consume taxes; but so do you. So. It's a give and take situation. And as long as we can keep an open dialogue about what the various needs are, I think you're more able to have a good conversation, and have your needs met. I think if you want to mitigate traffic, great. How do you subsidize mitigating traffic? It's fine and good to say take public transit, but when it's more affordable to drive your car up the hill, I'm going to drive my car. I'm not going to take the bus. I'm not going to take BART. Why would I? It's more expensive to take either of those options. Make it more affordable to take the bus, and I'll take the bus. I am also -- how many of the people who work at the Lab also live in Berkeley and drive right up the hill themselves? You know, we have 4,000 employees. If even 50 percent of those live in Berkeley -- 50 percent. How many of those people are driving up the hill themselves? If you're not starting within your

own community, you can't very well expect another institutions to follow through and honor what you're saying. You have to talk the talk and walk the walk.

I'd just like to say something as the scientist did about who this laboratory is going to benefit. Scientists serve the military, and scientists serve corporations. And the people who are going to benefit from the research of that laboratory, and the application or misapplication are going to be the military and corporations. And unless they can make money, unless they can benefit, we're not going to. So I think we need to keep that the mind. Nanotechnology, weapons, even research on fourth generation nuclear weapons is what is underway now, to where billions, and billions, and billions of dollars are being poured into now. This is why more than 30 world-class microbiologists have been murdered in the last year and a half. They were all working on DNA specific bio weapons. We invited Professor Ignacio Chappela to speak in the Berkeley City Council and at the public meeting he told us spermicidal corn is being tested in Mexico now. I believe Novartis developed it. Who will that spermicidal corn be used on? Is it people with brown skin? He said, "Well, we don't know." So who gets to make the decision on the application or the misapplication? Who gets to make the decisions on the application or misapplication of biotechnology? It's not us. It's the military, and it's corporations. They're destroying our lives, our environment, and our health. We need to make the connection: Where is the money coming from for this research, and who will decide what the applications are? Thanks.

MS. POWELL: I think we're done. Thank you very much for coming tonight.

(OFF THE RECORD, 8:55 PM)

---oOo---

APPENDIX B

LRDP Principles, Strategies and LBNL Design Guidelines

I. LRDP Plan Principles

Preserve and enhance the environmental qualities of the site as a model of resource conservation and environmental stewardship.

As a leader in energy and environmental research and the stewards of this extraordinary site the Laboratory has an opportunity and responsibility with each new project to be a model for environmentally responsible development. Construction of new facilities will take place on land within already developed areas of the site to allow undisturbed open space to remain at the site's perimeter. Sensitive habitats and riparian areas are protected and stands of screening trees will be protected and expanded to screen views to Laboratory buildings from all directions.

New buildings will be constructed to meet or exceed the UC Presidential Policy for Green Building Design. Whenever possible, new building elements and/or design strategies developed by University of California researchers will be showcased in new projects as a way to reinforce a "culture of sustainability" at Berkeley Lab. All of this will be done in a way that enriches the unique sense of place that is Berkeley Lab.

Build a safe, efficient, cost effective scientific infrastructure capable of long-term support to evolving scientific missions.

Life Safety is a top priority at Berkeley Lab. New facilities will provide state of the art protection against potential occupational hazards and will address the two natural hazards common to the East Bay region—wildland fires and seismic activity. Future development and landscape improvements will continue and strengthen the Laboratory's existing fire protection and vegetation management strategies that have served as a model to the region. The replacement of older facilities with new ones built to modern life safety standards will significantly reduce the threat to life safety in the event of fire and earthquakes as well as the potential occupational hazards of scientific research.

The efficient, long-term operation of a research institution where scientific needs are constantly changing is a challenge that demands a high degree of flexibility in the way new projects are planned and designed. Accordingly, the Plan provides the flexibility needed to meet both known and unforeseen programmatic needs in a cost effective way without compromising the environmental assets of the site.

Operational efficiency is also strengthened by bringing researchers and their programs closer together. Whenever possible, new projects will be located in close proximity to facilities with common activities and/or related research interests to capitalize on the benefits of collaboration and shared use of specialized equipment and facilities.

Build a more campus-like research environment.

Berkeley Lab's scientific endeavors rely on the healthy exchange of ideas sustained through formal and informal social interaction among scientists, engineers, students, and support staff. To build an environment that fosters this valuable social interaction, the design of new Laboratory projects will draw inspiration from university campus type settings. Future development at the Laboratory will place an emphasis on the pedestrian experience both indoors and outdoors to create a setting conducive to interaction and collaboration.

New projects will be planned to segregate pedestrian and vehicular circulation. Buildings, built at greater densities than they are now, will better define outdoor spaces between them. Future development will build upon the informal character of the Laboratory and lead it in a direction where buildings are not thought of as individual objects, but work in concert to weave the Laboratory site into a coherent whole.

Improve access and connections to enhance scientific and academic collaboration and interaction.

As the Laboratory takes on new challenges it will increasingly rely on the rapid innovation that emerges from interdisciplinary collaboration. Whether at the scale of individual researchers, or a consortium of public and private institutions working together, clear and convenient access to and around the Laboratory is vital to the work and culture of team science at Berkeley Lab. The Laboratory is committed to providing access in the safest, most environmentally responsible way possible. In 2006 nearly half of the Laboratory's adjusted daily population commuted to the main site on its shuttle system which has connections to UC Berkeley and regional mass transit systems. New and improved pedestrian routes will provide safe and direct linkages between on-site shuttle stops, facilities, and parking. The improved walkways will offer an outdoor amenity that not only provides a sense of connection to the natural setting and views but also promotes chance meetings along the way.

II. LRDP Planning Strategies

Land Use Plan Strategies

The Land Use Plan will guide future planning decisions; it has been configured to manifest four strategies that derive from an appreciation of the site's existing assets and constraints, the Laboratory's scientific vision and goals, and the planning principles that underlie this LRDP.

- Protect and enhance the site's natural and visual resources, including native habitats, riparian areas and mature tree stands by focusing future development primarily within the already developed areas of the site
- Provide flexibility in the identification of land uses and in the siting of future facilities to accommodate the continually evolving scientific endeavor
- Configure and consolidate uses to improve operational efficiencies, adjacencies and ease of access
- Minimize the visibility of Laboratory development from neighboring areas

Development Framework Strategies

The Development Framework defines the rationale for where and how new development should occur within the zones defined in the Land Use Plan and provides a means to implement these six strategies:

- Increase development densities within areas corresponding to existing clusters of development to preserve open space, enhance operational efficiencies and access
- To the extent possible, site new projects to replace existing outdated facilities and ensure the best use of limited land resources
- To the extent possible, site new projects adjacent to existing development where existing utility and access infrastructure may be utilized
- Create a more "collegial" environment that encourages and facilitates interaction among the variety of Berkeley Lab employees and guests
- Site and design new facilities in accordance with University of California Presidential Policy for Green Building Design to reduce energy, water and material consumption and provide improved occupant health, comfort and productivity
- Exhibit the best practices of modern sustainable development in new projects as a way to foster a greater appreciation of sustainable practices at the Laboratory

Vehicle Access, Circulation and Parking Strategies

The Vehicle Circulation and Parking Framework is based on a series of strategies designed to improve transit, access, circulation, parking, and safety at the Laboratory.

- Increase use of alternate modes of transit through improvements to the Laboratory's shuttle bus service
- Promote transportation demand management strategies such as vanpools and employee ride share programs.
- Improve efficiency and security of Laboratory access through improvements to existing gates and the creation of new gates
- Create a better linkage between parking, shuttle stops, and pedestrian circulation on site
- Provide separated routes of travel wherever possible for pedestrians and vehicles
- Promote use of bicycles by providing additional storage racks and shower facilities

- Eliminate parking from the sides of major roadways, thereby improving safety and allowing one-way roads to be converted to two-way traffic
- Maintain or reduce the percentage of parking spaces relative to the adjusted daily population
- Consolidate parking into larger lots and/or parking structures; locate these facilities near Laboratory entrances to reduce traffic within the main site
- Remove parking from areas targeted for outdoor social spaces and service areas
- Consolidate service functions wherever possible in the Corporation Yard

Pedestrian Circulation Strategies

The Pedestrian Circulation Framework incorporates the following strategies:

- Use pedestrian routes to connect the various developed terraces of the site which host the central and research clusters
- Improve the pedestrian spaces at the heart of the research clusters and adjacent to research facilities so as to support interaction among Laboratory users
- Separate pedestrians and vehicles whenever possible
- Retain and improve walkways as appropriate throughout the open space portions of the site, carefully integrating these pathways to minimize intrusion in the natural environment
- Improve pedestrian access and safety throughout the Laboratory site by developing new routes and enhancing existing routes
- Improve wayfinding through a comprehensive and coordinated signage system and through the naming of buildings and research clusters
- Improve the path providing access to and from the UC Berkeley campus

Open Space and Landscape Strategies

Both the Open Space Framework and the Landscape Framework are based on strategies that aim to preserve the environmental quality and enhance the overall experience of the Laboratory main site.

- Preserve and enhance the native rustic landscape and protect sensitive habitats
- Develop new campus-like outdoor spaces such as plazas within clusters of facilities and improve those that already exist
- Maintain and enhance tree stands to reduce the visibility of Laboratory buildings from significant public areas in neighboring communities
- Improve the overall appearance and experience of the Laboratory through improvements to the main entry gates, and the landscape areas associated with roadways, parking lots, and pedestrian pathways
- Continue to use sustainable practices in selection of plant materials and maintenance procedures

- Develop all new landscape improvements in accordance with the Laboratory’s vegetation management program to minimize the threat of wildland fire damage to facilities and personnel
- Utilize native, drought-tolerant plant materials to reduce water consumption; focus shade trees and ornamental plantings at special outdoor use areas
- Minimize impervious surfaces to reduce storm water run-off and provide landscape elements and planting to stabilize slopes, reduce erosion and sedimentation

Utilities and Infrastructure Strategies

The Utilities Framework incorporates the following strategies:

- Maintain a safe and reliable utility infrastructure capable of sustaining the Laboratory’s scientific endeavors.
- Consolidate utility distribution into centralized utility corridors that generally coincide with major roadways
- Ensure that utility infrastructure improvements accommodate future facility expansion and alterations in the most cost effective means possible
- Design infrastructure improvements to embody sustainable practices

III. Berkeley Lab Design Guidelines

The following LBNL Design Guidelines were developed in parallel with the LRDP and are proposed to be adopted by the Lab following the Regents' consideration of the 2006 LRDP. The LBNL Design Guidelines provide specific guidelines for site planning, landscape and building design as a means to implement the LRDP’s development principles as each new project is developed. Specific design guidelines are organized by a set of design objectives that essentially correspond to the strategies provided in the LRDP. The LBNL Design Guidelines provide specific planning and design guidance relevant to new development to achieve these design objectives.

The Land, Topography and Views

The landscape of the Lab is divided conceptually into five broad categories, as defined in the LRDP: Screening Trees, the Rustic Landscape, the Rustic Riparian Landscape, The Ornamental Landscape, and the Significant Ornamental Landscape.

Objective: Provide screening landscape elements to visually screen large buildings

- The large stands of screening trees at the Lab provide critical visual screening of facilities and operations. Tree stands that provide important visual screening, as well as zones identified for new stands of trees, have been identified in the LRDP.

- Whenever possible new plantings will be introduced to provide visual screening for future building sites, where shown on the LRDP Landscape Framework Map.

- Every effort to preserve important screening trees (as identified) will be taken when siting new facilities. In the event that screening trees must be removed for new projects new plantings of a species with adequate density, height and life-span will be strategically located as to provide visual screening of new and existing facilities.

- New screening tree species shall be compatible with the tree species already existing at the Laboratory**.**

Objective: Projects or portions of projects which fall within the Rustic Landscape zones identified on the LRDP Landscape Framework Map shall provide new plantings consistent with this zone.

- The Rustic Landscape is the natural setting of the Oakland and Berkeley Hills that the Lab as a whole sits within. This landscape zone forms an important perimeter buffer for the Lab as well as dividing belts between Research Clusters.

- Plant palettes for new plantings within the Rustic Landscape Zone shall be of species native to the bay area costal range. The plant material should be drought tolerant, non-invasive and low maintenance.

Objective: Projects or portions of projects which fall within the Rustic Riparian Landscape zones identified on the LRDP Landscape Framework Map shall provide new plantings consistent with this zone.

- The Rustic Riparian Landscape is those portions of the Rustic Landscape that have riparian habitats. These areas are identified on the LRDP Landscape Framework Map and are in many cases protected from development.

- Plant palettes for new plantings within the Rustic Riparian Landscape Zone shall be of species native to the bay area costal range. The plant material should be drought tolerant, non-invasive and low maintenance.

Objective: Within the Ornamental Landscape zones identified on the LRDP Landscape Framework Map provide new plantings consistent with this zone.

- The Ornamental landscape zones at the Lab are the areas of landscaping in and immediately around the Research Cluster development areas. Here a more ornamental palette of plantings can be used that is intentionally distinct from the Rustic Landscape.

- Plant Palettes within the Ornamental Planting Zones shall consist of ornamental trees, shrubs, and groundcovers planted within the commons area and in visual proximity to pedestrian walkways and parking lots.

- A comprehensive planting plan will assign a unique palatte to each developed cluster and special places like Laboratory entries and the Cafeteria Commons. The planting plan is intended to provide enhancements for the grounds, visual screening and orientation.

Objective: Provide a special feeling of arrival at Significant Ornamental Zones using distinctive landscape plantings and elements

- A handful of areas at the Lab have been identified as locations where significant, special planting and landscape treatments should occur, including the entrances to the Lab and the two major public commons spaces (see LRDP).
- Plantings and landscape treatments within the Significant Ornamental Zones shall be of a special, highly-designed nature.

Common Landscape Elements

Objective: Create a cohesive identity across the Lab as a whole by following established precedents for new landscape elements

- Landscape elements common across the Laboratory such as signage, lighting, outdoor furniture, fencing and visual screening shall be designed to provide a cohesive identity across the laboratory.
- To improve orientation and wayfinding, site-wide design themes for landscape elements may vary to express the identity of each Research Cluster.
- Special attention will be given to environmental art installations across the Laboratory site. Installations will enhance the experience of the Laboratory while providing practical assets that screen views to service areas, enhance wayfinding, provide walkway and retention structures.

Objective: Provide appropriate Site Lighting for safety and security

- For all new projects lighting of streets and parking lots will provide the necessary light levels to ensure safety and security while limiting impacts to the neighboring land uses.
- Pathway lighting will only be located on pedestrian spines connecting major commons areas and within commons areas. Use low height bollards of a design compatible with landscape design themes.
- Unique lighting treatments should be provided in selected areas of the site. These include the main entry gates, critical arrival points, landmarks and service entries. Site entry lighting will only be used to light the identity signage at the Blackberry and Strawberry Gates. In maintenance yards and equipment lay-down areas lighting may be pole mounted. All lighting will be cut-off type lighting designed to contain light in the work area without "spillover."

Landforms, Buildings, and Massing

New projects will be sited and designed to minimize the impacts to the existing hillside terrain and to minimize visibility from other parts of the lab and from surrounding communities.

Objective: Minimize impacts of Disturbed Slopes

- To the degree practicable cut and fill slopes will be minimized. Cut and fill slopes exposed to view shall be promptly restored, using best management practices to minimize erosion.

New vegetation should be planted in a manner to return the visual quality of the slope to a condition similar to its original state or better.

- Building footprints shall be designed with long-narrow aspect ratios in parallel to natural terrain to the degree consistent with program needs.

Objective: Create landform elements consistent with design on the Hill

- Given the dominant hillside site conditions of the Laboratory, site retention structures are a pervasive design element in the landscape. Design and placement of site retention structures shall integrate with the design of adjacent buildings and commons areas. Where possible retention structures should be used to minimize the impacts of new fill slopes.

Objective: Mass and site buildings to minimize their visibility

- To the degree feasible, the massing of new buildings will be configured to minimize their visibility when viewed from equal and lower elevations, and to complement the hillside terrain.
- Large buildings shall be designed to reduce their perceived mass and impart a human scale to the site. Buildings with a horizontal dimension greater than 200' or a vertical dimension greater than four stories shall incorporate changes in both façade plane and vertical height to reduce its perceived scale and bulk.
- Building heights for all new buildings are typically limited to four stories. However in locations where the site's topography creates a natural backdrop or provides appropriate visual screening building heights may be increased. New buildings shall conform to the height limits indicated on the building height map.

Objective: Screen Roofscapes

- Rooftops of Laboratory buildings are highly visible to residents and institutions at higher elevations. Attention shall be given to the design of rooftop surfaces and elements to minimize the visual impacts. Building and research support equipment shall be rooftop mounted only when required for the proper operation of the intended use of the equipment such as ventilators, lab vent stacks and scrubbers. Visual screening devices shall be used to screen views of such equipment from public view points at higher elevations. Rooftop screening devices and equipment shall be designed as elements integral to overall building design themes.

Objective: Respect View Corridors

- New buildings shall be configured as to preserve valuable distant views from commons, courts and key public spaces within neighboring buildings. Attention shall be given to create special "framed" and foreground views between pedestrian spaces that provide visual interest and orientation.

Objective: Integrate buildings into the overall landscape using appropriate materials

- The palette of exterior building materials allowed for new buildings shall be of a color and texture that integrates well with the natural environment and is consistent with the most durable and cost effective building assemblies for laboratory and office buildings.
- The base of new buildings—where building forms, slope retention structures, and outdoor plazas meet the hillside terrain—shall be cast in place or pre-cast concrete of a natural color and a texture consistent for base elements.

- Exterior wall materials will primarily consist of, but not be limited to, concrete, metal panel and glass curtainwall systems with featured accents of stone, wood and tile where appropriate. The color and texture of these materials shall integrate with the natural surroundings to reduce the visibility of buildings in distant views. A consistent palate of color and texture will be used to ensure a cohesive image and enhance orientation. Highly reflective materials and elements shall not be allowed unless they are deemed necessary to support mission needs.

Research Clusters

A key element of the Conceptual Framework established to guide development at the Lab is the concept of the Research Cluster. The Lab has been conceptually divided into six discreet Research Clusters – concentrated, dense developments of research buildings, each having its own subtly unique character and social structure. The creation of these Research Clusters will help to fulfill two of the four basic principles contained in the Vision of the Laboratory site and facilities;

- **Build a "campus-like" research environment**—one with a coherent development pattern and image conducive to team science; and
- **Enhance scientific and academic collaboration** with public and private initiates by improving access and connections.

Research Clusters will develop over time as the aggregate result of multiple development projects. It is important that each development respect the long-range development concept for each cluster and build on the efforts of its predecessors to work together towards a common, coherent goal. There are a number of fundamental parts of the Research Cluster concept.

The Commons

In order to encourage informal interaction within each Research Cluster, activities and new development in each Cluster will focus on a central campus-like collegial space called The Commons. Analogous to how a town square functions within a civic community or to a quad in a campus community, the Commons will form the social heart of each Research Cluster, creating a strong focal point, gathering space, and Sense of Place. Each Commons will have a unique scale, configuration, and character, depending on existing conditions and development scenarios.

Objective: Create new Commons Spaces in clusters that currently lack them

- New building sites and locations of new Commons Spaces shall be defined by Lab Planning, and new projects shall conform to the given footprints.
- New buildings shall be located and designed to create well-defined, campus-like pedestrian commons and courts between buildings that provide pedestrian access to buildings.

Objective: Stimulate pedestrian activity and interaction in the Commons Spaces

- Building facades facing commons and courts should provide exterior building spaces such as covered porches at main entries and covered walkways to provide exterior places of interaction weather protection.

- Major entrances to buildings shall be located on the Commons space when possible, or on major pedestrian routes where not possible.
- Seeing one's colleagues at work is an important stimulus to interaction. Therefore, the ground floors of buildings enfronting Commons spaces shall be made as transparent as possible to create a visible connection between inside and outside.
- Social and collegial spaces such as lounges, informal meeting spaces, journal rooms, etc shall be located either directly off of or overlooking commons spaces and shall be visible and made prominent from the outside.
- The use of arcades or covered walks where buildings form the edges of commons spaces shall be considered.
- Outdoor commons, courts and pedestrian pathways will have a hard surface appropriate to their function. Special outdoor spaces will feature patterned concrete and or brick inlay in a design consistent with building design themes. Pedestrian pathways are currently and will remain paved surfaces. Joint detailing and saw cuts may be used as a cost effective method of providing scale to these surfaces. Where possible permeable surfaces such as planting pavers shall be employed to increase the permeable surface areas in parking lots and plazas.

Objective: Allow light to reach the Commons Spaces

- Buildings facing outdoor commons shall be scaled to admit sunlight and impart a comfortable human scale to these places. Additionally, new building massing shall be configured to allow solar access for adjacent buildings to the degree feasible.

Objective: Create as high a density and critical mass around commons spaces as possible

- Buildings shall be massed with their greatest population density in proximity to the Commons spaces.
- Buildings within Research Clusters shall be built to as great a density as possible within the allowable development envelopes.

Identity

Each Research Cluster, because of topography, historic buildings, plant palette, and so on will develop a unique identity.

Objective: Create new Keystone Structures in clusters that currently lack them

- Over time, each developed cluster shall include a "keystone structure" the most visually significant structure in the cluster. Keystone structures will typically be the largest building in the group of buildings and will feature building elements of a scale and design that signify the unique character for the cluster to reinforce identity and orientation.

Objective: Utilize artifacts to create identity and add interest to each Cluster

- There are many interesting historic objects scattered around the Lab. These artifacts are important reminders of the Lab's legacy as well as items of interest which stimulate interaction. Placement of these artifacts at major pedestrian nodes and at prominent locations in each commons is encouraged.

Objective: Create consistency between buildings in individual clusters.

- Designers shall examine the architectural precedents, especially of historic buildings, present in the Research Cluster where their project is to be located. A clear rationale based on precedent for the architectural expression of each project will be developed.

Function

Objective: Segregate public entries and paths from service entries and paths where feasible

- Main building entries and service entries will be clearly separated. Main building entries shall face onto pedestrian spaces with common access to other buildings.
- Building entries and plazas shall be distinguished as a place by design treatment- paving, lighting, furnishings and shall incorporate provisions for disabled access.

Objective: Where segregation is not possible, and service and public access overlap in accessing buildings, design service courts to intelligently serve both

- Pathways to main entances shall be clearly marked and protective measures for pedestrians shall be designed.
- Multi-use pedestrian and service access courts and routes shall be designed to slow vehicle traffic using articulated paving, bollards, or other devices.

Objective: Develop Research Clusters in a way that is mindful of future expansion

- Identify and reserve areas for future expansion on each building project.

Linkages

The Hill Site is characterized by its steep topography which creates separate research clusters located on a series of hillside terraces and ridges. The topography is such that one can never get a comprehensive view of the place. Rather, one’s experience of the site is defined by the movement from area to area, from terrace to ridge to valley. Views are constantly shifting, changing, and opening anew. The pathways that link various areas together, both vehicular and pedestrian, are important linkages, both for the experience of the place and for encouraging people to move from place to place, to visit, and to explore. The design guidelines in this section are intended to ensure pedestrian and vehicular access is provided in a way that creates a campus-like experience unique to the Lab while providing safe and efficient access to all Laboratory facilities.

Pedestrian Access

The Hill site is an intricate network of stairs, roads, and paths that negotiate the steep topography of the site. As each new project is developed adjustments may be made to the existing network of pedestrian pathways as necessary to provide direct access between each cluster commons, parking lots and Laboratory gateways.

Objective: Design Pathway Layouts that support pedestrian flow and encourage casual interaction

- Development of new pathways and improvements to existing ones shall provide a natural appearing unobtrusive network with structural elements artfully placed and designed as landscape features.
- Pedestrian pathways providing access between cluster commons currently, and will continue to vary in width. The main pedestrian spines, between major commons areas shall be constructed of a width of approximately 8'-0" allowing two pairs of pedestrians to pass comfortably. Pathways along roadways and between all other commons areas shall remain at their current width.
- Pathway intersections, view platforms and stair landings provide opportunities for outdoor interaction spaces. The design of new walkways shall incorporate such spaces to the extent possible.

Objective: Materials utilized in walkway construction should be appropriate for their location and intended use.

- Material choices for walking surfaces may include, but are not limited to asphalt, stabilized aggregate, concrete pavers and patterned/colored concrete. Within new projects Pathway materials and colors shall be consistent with surfaces provided in commons and plaza areas.

Objective: Construct new walkway structures such as stairs, bridges, slope retention for walkways and guardrails of materials compatible with the surrounding landscape

- Use concrete, wood or core-ten steel.
- Design themes for these structures should be coordinated with adjacent building design themes, designs for shuttle stop shelters, signage and lighting to provide a comprehensive visual identity across the laboratory site.

Guideline: Use buildings to overcome the topography and provide ease of pedestrian flow and disabled access

- Where possible, design interior and exterior circulation to provide pathways from lower elevations to higher elevations, using elevators to overcome large differences that can't be accommodated by ramps.

Vehicular Access – Roads

Objective: Design all new streets to accommodate two-way vehicle traffic flow as well as pedestrian access

- Streets shall primarily be no greater than 24'-0".
- Curbs and sidewalks shall be provided where appropriate for pedestrian safety and erosion control.

Objective: Create service yards with sufficient room and in a manner that controls polluted runoff.

Service yards and access roads shall be of a width necessary to maneuver delivery trucks and emergency vehicles. Surfaces shall be asphalt with concrete pads as necessary to provide a durable truck staging area at loading docks. Surface drainage in these areas will be directed away from landscaped areas and into collection intakes to reduce seepage of contaminating oils and other chemicals.

Objective: Reduce the amount of impermeable surfaces at the Lab

- Permanent roadways will be surfaced with asphalt or other materials that will prevent seepage of contaminating oils and sediments. Roadways shall be constructed to support truck loads as specified in Lab road standards. Access roadways intended for limited access and emergency access only may be constructed with landscape pavers to increase permeable surfaces.

Vehicular Access – Parking Lots and Plazas

The intent of the Parking Design Guidelines to integrate parking into overall site appearance through measures that minimize visual impact, protect water quality, limit the negative effects of associated noise lights and utilize materials that result in the least environmental impact.

Objective: Minimize visual and environmental impacts of new parking lots

- New parking and improvements to existing lots shall be sited and designed to minimize their visual impacts to off-site locations, visitors and Laboratory staff.
- New parking lots shall be designed to follow the existing terrain and shall be terraced to minimize slope retention and cut and fill of the site.
- Drainage from the parking areas will be contained by natural materials that can be used as edge treatments to guide drainage to filtered outlets and control erosion at the pavement edge. Gutters and or wheel stops shall be used to keep cars out of swale and other surrounding areas.
- Parking areas shall be screened in a way appropriate to location of the parking lot on the site and the characteristics of the surrounding area. Native trees and shrubs within parking lots will be maintained and planted to provide shade and screen distant views to lots from both on and off-site locations. Native shrubs and small trees will be planted at the lot's perimeter to cause the parking and its screening to recede into the natural surroundings. Provide shade trees interspersed throughout to break up large parking areas.

Objective: Create parking plazas to accommodate multiple functions where restricted sites do not allow for them to be segregated

Parking plazas are a multi-use space capable of providing space for delivery, emergency access and reserved parking in conjunction with safe pedestrian access routes to building entries within constrained spaces.

- Reduce parking density within the plaza to allow free pedestrian movement and generous landscape plantings.
- Provide barriers such as raised planting beds, bollards, and ramped walkways to slow traffic and allow a protected zone for pedestrian movement.
- Provide plaza surfaces that resemble that of pedestrian-only spaces to reinforce the pedestrian use of the space and slow traffic.

Vehicular Access – Parking Structures

Objective: Site and design parking structures to integrate with the natural surroundings.

- Configure parking layouts to allow floor plate aspect ratios and massing that is fitted to the specific conditions of the site—long, narrow structures (1-2 aisles) on hillside sites and square structures (3-4 aisle) on level sites.
- Configure efficient parking layouts to reduce the area dedicated to circulation by allowing entry points from multiple levels of the site.
- Parking structures and associated site retention structures shall be constructed of cast-in-place and/or pre-cast concrete. Surface texture shall be compatible with adjacent architectural design themes. Finish color will be compatible with surrounding buildings and is intended to blend with the natural surroundings. Enclosed lobbies, and stairwells may be clad in glass.
- To the degree possible incorporate shade trees and plantings that the building's perimeter and top level exposed to view. Provide adequate tree coverage at the top level to shade cars, reduce glare, and minimize visual impacts. Continuous planting beds at each level may be incorporated into the structure's façade to further integrate the structure into the surrounding landscape.

Building Specific Guidelines

The intent of the Building Specific Guidelines is to establish a building design aesthetic at Berkeley Lab that is sympathetic to the Laboratory's hillside setting and the Guideline to build a UC quality campus experience through each new project. An overriding Guideline is to minimize the visual impact of buildings to the extent consistent with program needs while also providing flexible facilities that can accommodate expansion and alterations.

Building Organization

Objective: Create buildings that are flexible, modular, and expandable

- Each new building shall be configured to accommodate a broad range of functions in both the long and short term. In general a building width of between 60' and 80' can accommodate a variety of office, lab and support space layouts. Structural grids shall be based on dimensions compatible with industry standards for laboratory equipment and furniture and office modules to ensure future flexibility.
- Each new building shall have a floor-to-floor height of at least 15'-0" in order to accommodate a wide range of research functions and the infrastructure they require. A greater height on the ground floor may be provided to accommodate large public assembly spaces and or high-bay laboratory spaces.

Objective: Create buildings that encourage interaction among their inhabitants

- Circulation, both vertical and horizontal shall be designed to foster communication by being enjoyable places, provide access to daylight and views.
- Active public spaces such as lobbies, meeting and break rooms, display areas shall be located adjacent to outdoor spaces and pedestrian routes and pathways.

Objective: Organize service functions to minimize conflicts and visual impacts

- Service entries and associated equipment and activities shall be located to minimize visibility. All bulk trash containers, building and support equipment shall be concealed within enclosures designed as integral elements of the architecture. Loading docks shall be concealed and secured when not in use.

Architectural Expression

Objective: Insure each new building contributes to cohesive and coherent architectural expression through the Laboratory site

- Each building shall be a coherent architectural composition and shall employ a single unifying vocabulary of forms, details and materials on all building facades. Design themes for new building facades shall be designed to integrate new development into the natural and built context and to provide a cohesive Laboratory image. The architectural expression of each new building will promote the enduring architectural themes of each cluster that contributes to the cohesiveness of the overall visual fabric of the Laboratory.
- The design of building facades shall consider treatments that respond to the characteristics of each exposure with respect to heat, light, ventilation and view. Provide shading devices to reduce solar heat gain and glare particularly on the larger southern and western exposures directed toward distant bay views. Employ devices and design strategies to allow natural ventilation and air flow to the degree feasible. Use larger glazed exposures to the north and east for natural light.

APPENDIX D
Individual Future Projects

Individual Future Projects

User Guest House

As a major element of its mission, Berkeley Lab has built and operates one-of-a-kind scientific facilities for use by academic and other researchers from around the world. The majority of users visiting these facilities are from outside the Bay Area and must obtain short-term housing. Faced with a shortage of convenient, affordable housing near Berkeley Lab, the user communities have requested that on-site, low-cost, short-term housing be made available.

The Laboratory is responding to the lack of on-site housing for its guests by proposing the Berkeley Lab Guest House project. The Guest House would provide customer-centered, low cost and accessible services; a safe, clean, smoke-free and technology-enhanced environment; an effective visitor transition into LBNL; a visitor and user- oriented service experience; and 24-hour convenient access to research-support amenities and science facilities.

The proposed project site is a one-acre University-owned parcel with a filtered San Francisco Bay view and frontage on Lawrence Road in the interior "Laboratory Commons" area of Berkeley Lab. The site is directly across from the Cafeteria, adjacent to Building 2, and near to the Advanced Light Source, a Berkeley Lab landmark. Three unusable modular buildings and three-stack parking spaces currently occupy the site. The sloped terrain drops approximately 40 feet from east to west and is populated by oak, pine, and eucalyptus trees.

The building would be designed in accordance with the LBNL's design guidelines and would respect the scale, rhythm, and patterns of the surrounding architectural context through massing, exterior finishes, and other architectural elements. Exterior materials would be chosen to be compatible with the surrounding neighborhood. Common-use areas in the project include a main lobby, lounge areas, a fitness center, laundry, vending areas, and outdoor patio.

The Guest House would be a three- story single building of Type V construction (wood frame)18,400 ASF and 70 beds. The 18,400 assignable square-foot (ASF) building would have a double loaded corridor, one elevator and exit stairwells at the each end.

The Guest House would provide 70 beds for short-term visitors at the Berkeley Lab in single- and double-occupancy rooms for a total of 12,900 ASF in living quarters. The 44 standard-size rooms would be approximately 190 gross square feet (gsf) and would each include a full-size bed. Twelve larger size rooms would be approximately 250 gsf and include either one queen-size or two full-size beds. Four studio suites would be approximately 350 gsf and include a kitchenette plus either a queen-size bed or two full-size beds. Four of the studio size rooms would be handicapped-accessible, built to meet the requirements of the Americans with Disabilities Act.

The building would be sited to maximize the site by positioning the structure to align with the natural topography, respond to new and existing pedestrian paths, and position guest rooms to view San Francisco Bay. All of the units would have exterior windows to provide natural light. The main entry would have access from Lawrence Road, with additional entries to common areas. Each point of entry would reinforce the pedestrian corridors that would link the facility to the adjacent buildings and parking lots. The building would be set back from Lawrence Road to provide a driveway and drop-off/pickup point at the front entrance.

Parking spaces would be provided for disabled Guests; and additional, limited-time spaces would be provided for use by delivery vehicles, taxis, and by Guests during check-in/out. Otherwise, no new parking is planned to be included in the project. Staff parking would be provided in the existing parking lots. It is anticipated that less parking would be required by Guests overall as a result of this project, as they would be more inclined to take public transportation or a taxi to/from the Guest House and not rent a car for daily use between regional accommodations and Berkeley Lab.

The Guest House would meet or exceed the Presidential Policy for Green Building Design and Clean Energy Standards. The 1987 LRDP, which governs this project, includes guidelines to achieve specific facilities planning requirements while respecting site constraints and providing coherence among building elements and the landscape. The LRDP addresses issues such as building scale, the relationships to surrounding buildings, the interface with the streetscape and sidewalks, pedestrian circulation, parking, open space and outlooks, landscaping and plantings, exterior material & design compatibility, energy efficiency, and environmental sustainability. These guidelines would be included in the design criteria within the contract awarded to the project architect at the beginning of the Design/Build Request for Proposal.

Construction of the project would begin in December 2007 and would be completed in March 2009. Construction considerations would include:

- Sloping Terrain. The sloping site would require extensive site work to form a flat construction site, retain the hillside, and protect the environment during construction. Proximity to associated facilities, the routing of roads and utilities, parking areas, facility entry/exit points, and pedestrian circulation paths are all made more difficult by the varying terrain around the designated site.
- Parking and staging limitations. The site includes a relatively constrained adjacent laydown area and would require remote parking with a shuttle service for the construction work force.
- Near-fault condition. Because the project site is within a few hundred yards of the Hayward Fault, a more robust structure and complex building techniques are required to meet the stringent seismic safety requirements.

Helios Research Facility

The proposed project site is a two-acre University-owned parcel adjacent to the Materials Sciences Research Cluster area of Berkeley Lab. The site is at the Hill Area east of the main hill site, on southern side of the Berkeley Laboratory; with a view of San Francisco Bay, flanked by LBNL Buildings 62, 66, 67, and 72 to the east. The sloped terrain of the proposed building site drops approximately 80 feet from east to west and is populated by a small number of pine and immature redwood trees. The proposed primary access road would be an improvement to the existing UC Berkeley corporation yard road that connects to Centennial Drive and winds through laurel, eucalyptus, and oak trees.

The UC Berkeley main campus chemistry, physics and biotechnology and bioengineering research facilities at the eastern side of campus would be readily accessible by a short shuttle bus trip or a walk through Strawberry Canyon. A key benefit of this building site is its adjacency to three Berkeley Lab national user facilities - the Advanced Light Source, the Molecular Foundry, and the National Center for Electron Microscopy. In addition, the Joint Genome Institute is 18 miles east. These facilities will be available for, and vital to, the success of the Helios research program.

The building would align with the site's natural topography, respond to new and existing pedestrian paths, and be oriented towards the view of San Francisco Bay. The main entry would have open access from Centennial Drive, with additional entries to common areas and for maintenance access. In addition, a controlled-access entry would be provided from Berkeley Lab. Each point of entry would reinforce the pedestrian corridors that would link the facility to the adjacent buildings and parking lots.

Up to ten parking spaces adjacent to the building would be included with the project and reserved for disabled drivers, vanpools, and limited-time use by delivery and maintenance vehicles. The corporation yard would be relocated to make room for a parking area; a fifty-space surface parking lot, readily accessible by building occupants, may be provided under a separate project.

The Helios Research Facility would be a lab/office. The new building would be approximately 90,000 gross square feet and 3 to 5 stories tall. It would feature flexible, cross-disciplinary space assignments so as to foster interaction and collaboration between diverse scientific and engineering communities. The scientific disciplines would be approximately two-thirds Bioengineering and one-third Nanostructured Materials. Functionally, the space would be approximately one-third wet laboratory space, one-third dry laboratory and research support space, and one-third office/conference space including a 250-person auditorium.

Specialty requirements for biological engineering include greenhouse facilities, cool rooms, molecular and microbial biology labs, fermentation labs, a high-throughput screening facility, and analytical facilities. Space needs specific to nanostructured materials include low vibration / electrical noise areas for scanning probe microscopes and custom-built electron microscopes. Other space needs include a low-level clean room space (class 10,000), and catalysis, electrochemistry, chemical separations, and computational research laboratories.

The Facility would be designed to be consistent with the 2006 LRDP and design guidelines with respect to the scale, massing, exterior finishes, and other architectural elements. Exterior materials would be chosen to be compatible with the surrounding buildings and the natural setting.

The Helios Research Facility would exceed the Presidential Policy for Green Building Design and Clean Energy Standards to demonstrate the principles of the research endeavor through environmental stewardship and resource conservation. The facility would be designed and constructed to feature innovative solar energy use, meet the U.S. Green Building Council's LEED[1] Gold level for sustainability; and to outperform the required provisions of the California Energy Code by at least 40 percent.

[1] LEED: Leadership in Energy and Environmental Design

CRT Building

The proposed project site is a 2.25-acre University-owned parcel in the Blackberry Gate area of Berkeley Lab. The site is at the west end of the Laboratory, and features a filtered San Francisco Bay view and frontage on Seaborg Road, flanked on three sides by Buildings 70 and 70A to the east, the Building 50 complex to the north, and the Blackberry Gate to the west. The sloped terrain drops approximately 100 feet from east to west and is populated primarily by eucalyptus trees among a small number of immature oak and redwood trees.

The site is within walking distance or a short shuttle bus trip to the UC Berkeley Physical and Computer Science Departments. Pedestrian spines would be established to Cyclotron Road and already exist to the Building 50 complex, and to Buildings 70 and 70A. The building would maximize the site's potential by positioning the structure to align with the natural topography, respond to new and existing pedestrian paths, and align offices to view San Francisco Bay. Offices would have exterior windows to provide natural light to the extent feasible. The main entry would have access from Seaborg Road, with additional entries to common areas. Each point of entry would reinforce the pedestrian corridors that would link the facility to the adjacent buildings, shuttle bus routes, and parking lots. The building would be set back from Chu Road to maintain a sense of openness at the main entrance to the Laboratory.

Parking spaces would be provided for disabled Guests. Additional, limited-time parking spaces would be provided for use by delivery and maintenance vehicles. No additional new parking spaces would be included in the project. Staff parking would be provided in the existing parking lots. The site is within 500 feet of both the Horseshoe Parking Lot F to the south and Blackberry Canyon Parking Lot D to the north.

The pre-conceptual building plan includes 32,000 gross square feet (gsf) of computing space and 80,000 gsf of office**,** visualization lab, and conference space. This computer floor size is two-thirds larger than the floor space at LBNL’s leased computer floor in Oakland in order to accommodate two high-performance computing systems at one time and anticipated growth in the scientific cluster support area. The office space would accommodate approximately 75 UC Berkeley staff and students, and 225 Berkeley Lab staff. The facility would also include 35,000 gsf of electrical/mechanical space to serve the computer electrical load and provide the cooling required. The facility would have a floor footprint of approximately 35,000 gsf, smaller footprints for the upper floors, and it would be 6 or 7 stories tall.

While a new electrical feeder would be installed from the Grizzly Peak Substation, all other major utilities are available in the immediate area. A geologic fault investigation performed in September 2006 in conformance with the Alquist-Priolo Act revealed no traces of an active fault on the proposed project site.

The CRT Facility will meet or exceed the Presidential Policy for Green Building Design and Clean Energy Standards. The building site and size of the facility are consistent with the 2006 LBNL LRDP. The building would be designed in accordance with the LRDP Design Guidelines and respect the scale, rhythm, and patterns of the surrounding architectural context through massing, exterior finishes, and other architectural elements. Exterior materials would be chosen to be compatible with the surrounding neighborhood.

APPENDIX E
Description of Existing Buildings 71 and 88

Condition of Existing Buildings at LBNL

Figure E-1 depicts conditions of existing buildings at the Berkeley Lab's main site in the Oakland-Berkeley hills. The following provides background information regarding two existing, potentially historic buildings.

Building 71 - Hilac/SuperHilac/Bevalac

Function

Building 71 was designed by the San Francisco architectural firm of Corlett and Spackman and constructed in 1957 to facilitate nuclear science studies. The building initially housed the Heavy Ion Linear Accelerator, or Hilac, which was one of the world's first accelerators built specifically for heavy-ion research. The basic elements of the Hilac were a Cockcroft-Walton generator and two Alvarez-type linear accelerators. Between 1958 and 1970, a team of Hilac scientists headed by Glen Seaborg and Albert Ghiorso was responsible for the discovery and synthesis of the elements 102-Nobelium, 103-Lawrencium, 104-Rutherfordium, and 105-Hahnium. (Element 106-Seaborgium was produced by the SuperHilac in 1974.)

The equipment and infrastructure in the Hilac were modified and upgraded in 1961, 1965, and 1969. The Hilac was converted to the SuperHilac in 1971-72, which enabled the machine to accelerate beams of all ions at higher speeds.

In 1974, the SuperHilac was connected to the Bevatron. The result was the hybrid facility known as the Bevalac, which combined the best features of both machines: the heavy ion capability of the SuperHilac and the high-energy capability of the Bevatron. Capable of accelerating even the heaviest of nuclei, the Bevalac was used to study how nuclei matter behaved under extreme conditions and how it changed from one physical state to another.

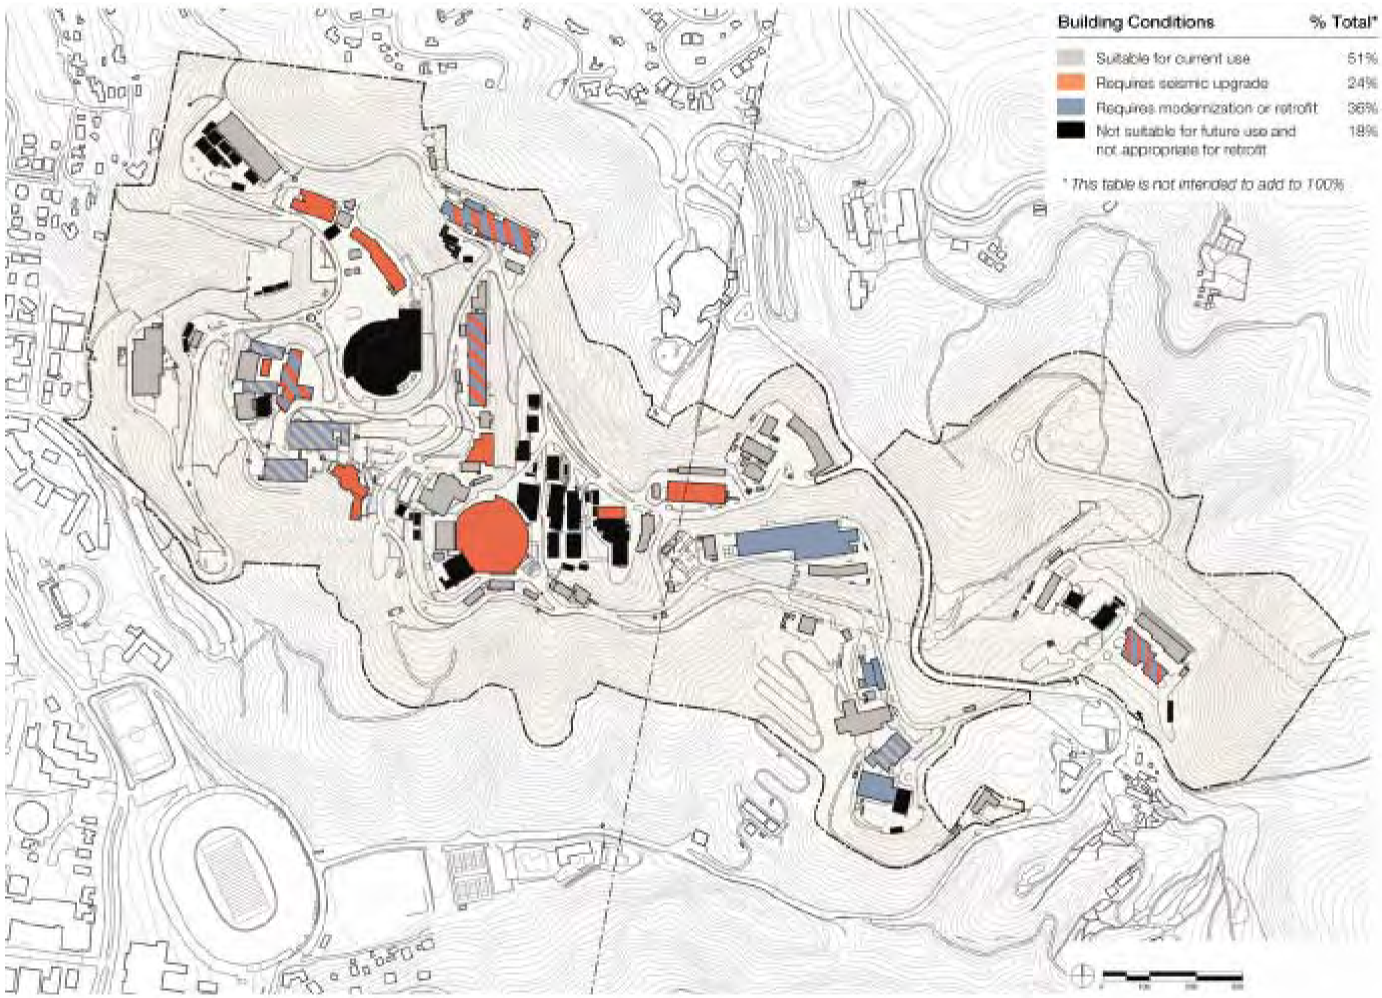

Figure E-1
Conditions of Existing Buildings at LBNL Main Hill Site

The Bevalac was used for medical research, cosmic ray experiments, and radiation therapy for the treatment of cancer. After an upgrade in 1981, the Bevalac became the only accelerator in the world capable of accelerating to near light-speed all of the naturally occurring elements of the periodic table, including ions as heavy as uranium.

The Bevalac offered researchers high intensity beams of carbon, oxygen, neon, and argon, which were produced and accelerated in the SuperHilac and transferred down the beam line to the Bevatron for further acceleration. The Bevalac had up to 500 user association members who represented nuclear science, cosmic ray research, and biological and medical interests from all over the world.

Physical Description

Exterior

Building 71 is a modified rectangular structure with an east-west orientation that was built in several phases or increments into the hillside. The downhill side of Building 71 is a two-story structure, while the uphill side is generally a one-story structure. Building 71 was originally shaped as two parallel rectangles with unequal height and dimensions. Today, the main building covers approximately 57,000 square feet in area. (The larger downhill rectangle measures 191 feet by 29 feet by 38 feet high.) The elements of the SuperHilac were added on all sides giving the structure an irregular shape. The building reflects an industrial vernacular -- international style with linear, symmetrical features and minimal façade ornamentation. The building features steel-frame construction; a flat roof; solid exterior walls of precast concrete, fluted metal, and steel panel cladding occasionally broken up by a horizontal band of windows; and a monochrome painted exterior.

Interior

The main Building 71 high bay housed two injectors, a linear accelerator, and a switchyard. A third injector was housed in a smaller high bay adjacent to the main building. The main high bay also included the terminus of the 550-foot beam transfer line that consisted of four-to-six-inch diameter pipe that linked the SuperHilac to the Bevatron. Offices, laboratories, shops, and mechanized support services were and continue to be located in the rear of Building 71. Today, the pre-stripper and post-stripper tanks, several pieces of supporting infrastructure, and switchyard magnets are what remain of the Hilac, SuperHilac and the Bevalac. The three injectors, portions of the linear accelerator, and the beam transfer line to the Bevatron have been removed. Most of the caves have also been extensively modified and/or removed.

In 1998, the American Chemical Society nominated Building 71 as a National Historic Chemical Landmark. Buildings 71 received National Historic Chemical Landmark status, due to the discoveries of eleven transuranium elements that were made in these buildings between 1949 and 1999.

Building 88

Function

Built between 1958-1962, Building 88 houses the 88-inch cyclotron and has been used for heavy ion research. The cyclotron was developed by a team of scientists and engineers at the Berkeley Laboratory under the direction of physicist Dr. E. L. Kelly (Lawrence Radiation Laboratory n. d.).

The Laboratory's Nuclear Science Division operates Building 88 and the 88-inch cyclotron in support of DOE programs in basic nuclear science. The cyclotron was originally built as a general-purpose accelerator for the nuclear chemistry program to accelerate heavy ion beams from the center region to the its radius, where high voltages were used to deflect the beam out of the cyclotron.

The 88-inch cyclotron, which accelerates protons and alpha particles to variable energies up to 100 MeV (Million electron-volts), is one of the new generations of cyclotrons that were built after 1960. These third-generation accelerators incorporate the high beam intensities of first-generation, conven¬tional cyclotrons with the high energies of second-generation synchrocyclotrons. The capability of accelerating various particles to any required energy, which was pioneered on several of the older cyclotrons, is present in many of the new accelerators, such as the 88-inch cyclotron (Lawrence Radiation Laboratory n.d.).

The 88-inch cyclotron is a versatile accelerator in support of DOE programs in nuclear science and research in areas of nuclear reactions, nuclear astrophysics, and chemistry. The accelerator's flexible design regularly produces a variety of species of beams. The more electrons that are "stripped" during the process of acceleration, the higher the possible energy of accelerated ions. During the acceleration, large electromagnets are used to steer the focus of the beam to the experiments. Sophisticated vacuum systems protect the beams from losing energy during the process.

Recently the cyclotron was enhanced with the addition of an Advanced Electron Cyclotron Resonance (AECR) ion source, located on top of the vault, which enables the accelerator to boost its beams to higher energies than previously obtainable.

Physical Description

Exterior

Building 88 was designed by San Francisco architects Gerald McCue and Associates. Constructed in 1960-62, Building 88 is representative of the International Modernist architectural style with its sharp, distinctive building lines, structural steel frame, steel girders and columns, flat (insulated) metal deck roof, vertical metal cladding, symmetrically placed industrial windows, and minimal surface ornamentation. The most notable feature is the high bay that houses the vault, cyclotron, and caves. The building covers approximately 50,700 square feet. Over the years, additions were constructed to provide extra space for scientists and other personnel conducting experiments. All of the additions matched existing construction features and materials.

Interior

The Building 88 interior is a high bay housing the cyclotron, vault, caves, ion sources, laboratories, shops, counting rooms, a control room, and offices that support the 88-inch cyclotron operations. A 30-ton ceiling crane in the upper reaches of the high bay maneuvers large, moveable concrete blocks around the cyclotron to provide protective shielding during experiments. Other interior features include concrete floors; an exposed, metal ceiling in the high bay; acoustic tile ceilings in the offices; steel beams that provide structural support; insulated metal panel walls; gypsum board partitions; and roll-up, corrugated metal, garage style doors.

Conclusion

Following investigation by a qualified historian and discussions with the State Historic Preservation Office, Building 71 and 88 may be recommended as eligible for inclusion in the National Register. While both properties have not retained all the historic physical features that contributed to their significance (i.e., laboratory equipment, machinery), they may have retained enough characteristics that enable them to convey their National Register significance.

It is likely that the significance of both of these buildings lies more in their technological features than in the buildings themselves. Thus, any changes to the exterior of these buildings, as well as changes to the interior that do not modify and/or remove remaining historic scientific and technological equipment or parts, might not adversely affect the integrity of those features that contribute to the significance of these buildings.

APPENDIX F

LBNL Draft Transportation Demand Management Program

Final Draft, December 7, 2006

Overview and Current Conditions

The purpose of the LBNL Transportation Demand Management (TDM) Program is to reduce total vehicle trips to and within Berkeley Lab, reducing emissions as well as traffic impacts and parking demands. The strategy is to implement TDM programs that increase awareness among staff and offer incentives to access the Laboratory by means other than the use of single-occupant vehicles, including public transit, carpools and vanpools, bicycling, and walking. Besides reduced traffic, emissions, and parking demands, other benefits include improved air and environmental quality, and improved relations between the Laboratory and the City of Berkeley and UC Berkeley due to reduced impacts.

Berkeley Lab's TDM Program facilitates a range of commute options for its employees that have served to reduce commuter vehicle trips to the Lab. As of the most recent Berkeley Lab transportation study, it is estimated that approximately 52% of Laboratory staff and visitors use their personal vehicles to commute to the Laboratory (see table) – a rate of use of alternative transportation modes comparable to institutions in dense urban areas. Further practices can be put in place, all of which will require increased resources, either directly in the form of expenses or indirectly due to staffing needs for implementation. The Lab is projected to experience moderate growth over the next twenty years, the impacts of which will be partially offset by the implementation of additional TDM practices.

Berkeley Lab limits the supply of parking available to employees, currently providing spaces for approximately 50% of its Adjusted Daily Population (ADP), reflecting the high degree to which access is achieved by means other than single-occupant vehicles. There are currently 2,300 parking spaces at the Laboratory, distributed as shown in Table 2.

Currently there are 1,932 general use parking spaces available (including spaces for the disabled) to serve an approximate ADP of 4,515. Parking at the Laboratory is free, but is allowed by permit only. Parking permits are provided to career employees and participating guests. The Laboratory has typically provided one free employee parking space for each 1.7 to 2.0 staff person and user/guest that is authorized to park an automobile on the Laboratory's main hill-site during the work day. Parking spaces are provided in an array of moderate to small surface parking lots dispersed throughout the Laboratory, and along the sides of many roads. There are currently no parking structures on the main site.

Table 1: Current Mode split estimates based on FY2000 employee transportation survey:

Mode	% of total	Number
Drive Alone	51.8%	2266
carpool >2x week	7.7%	336
motorcycle	2.7%	119
LBNL Shuttle	9.7%	426
LBNL Shuttle & bike	3.8%	168
Bicycle only	5.7%	248
Walk	4.3%	190
Current Transit	10.7%	469
Telecommute 2+x week	3.6%	156
Total	**100.0%**	**4376**

Table 2: Current Parking Mix

Parking Type	No. Spaces	No. Permits
Orange (employee)	32	26
Blue (employee)	309	792
General (employee)	1,552	2,523
Disabled	39	0
Emergency	3	0
Gov. Vehicle	271	0
Loading Zone	43	0
Motorcycle	23	101
Timed	11	0
Visitor	17	0
Total	**2,300**	**3,442**

Berkeley Lab has experienced an increase in demand of 25 to 30 parking spaces a year for the last fifteen years from staff population growth and an increasing demand on user facilities. This trend is expected to continue for the foreseeable future. Historically the lab has been able to meet this demand through providing an increased number of parking spaces, by creating stack parking, re-striping existing spaces for compact cars, and building additional surface parking lots. The Laboratory has added approximately 650 spaces over the past 16 years. The 1987 LRDP allowed for a total of 2410 spaces, a number which has not yet been reached.

The 2006 LRDP includes the projection of 500 net new parking spaces being added to the Laboratory over the next 20 years, accompanying a net Adjusted Daily Population increase of 1,010, meaning that the ratio of parking to population will be reduced. The draft EIR analysis of the 2006 LRDP indicates that key intersections in the City of Berkeley will be significantly impacted when the number of parking spaces at the Laboratory is increased beyond 375. It is hoped, therefore, that through the implementation of further TDM measures over the course of the LRDP time frame, the demand for parking will be reduced such that the number of new parking spaces added to the Lab will remain below the 375 figure.

Current TDM Measures

Berkeley Lab's current TDM program includes the following measures:

Laboratory Shuttle Service
The TDM component that has the greatest impact on Lab traffic is the Berkeley Lab Shuttle system. A system of small buses, the shuttle is offered free to Berkeley Lab employees and visitors. The shuttle has an on-site route that serves passengers within the Laboratory campus, and a number of external routes that connect the Laboratory to various locations within the City of Berkeley, including UC Berkeley, major AC Transit stops and BART stations. Stops are served generally every ten to fifteen minutes during normal working hours, Monday through Friday. The shuttle buses include racks for bicycles, so bicyclists can ride the shuttle up the hill and bicycle down. The shuttle reduces vehicle trips within the Laboratory, and provides access to the Laboratory for commuters using public transit such as BART.

Guaranteed Ride Home
The Lab provides a guaranteed ride home via Lab Security or taxi in case of family illness, family crisis, unscheduled overtime, or other emergencies. This encourages Lab employees to use alternative means of transportation getting to the Lab, as they can feel comfortable that in unusual or emergency situations they will be able to get home quickly. The Lab also participates in the Alameda County Guaranteed Ride Home program.

Pretax Transportation Program Incentive
Berkeley Lab offers employees participation in the "WageWorks" program, which enables Lab employees to deduct transportation costs of up to $100 with pretax dollars. This incentive offers commuter participants a discount of up to 40% for public transportation expenses such as BART or AC Transit tickets.

Carpooling/Vanpooling
The Lab's website links employees to Rideshare, a free regional ridesharing agency. Lab employees who participate in Rideshare can also deduct voucher expenses with pre-tax dollars as part of the Pretax Transportation Program.

Telecommuting and Flex Time
The Laboratory supports telecommuting, reducing the number of daily trips to the Lab by employees. The Laboratory also allows for flexibility in work hours to reduce peak demand.

Limited Parking
Parking is limited and difficult at the Laboratory, and is regulated through the use of parking permits. This discourages personal vehicle use.

Clean-fuel Vehicles
The Laboratory has an ethanol fueling facility and uses bio-diesel in some fleet vehicles.

Other related practices and benefits

Pedestrian Network
Berkeley Laboratory has a well developed internal system of pedestrian routes, encouraging pedestrian activity in lieu of the use of vehicles. This pedestrian network is connected to the UC Berkeley campus, the City of Berkeley, and surrounding neighborhoods, thorough a series of secure pedestrian gates. The network is lighted for security and to encourage use.

Government-owned Vehicles
The Laboratory owns and maintains a number of vehicles for Berkeley Lab business use. Employees who come to work without a personal car have access to a vehicle for short trips.

Bicycle infrastructure
Bicycling is a popular form of non-auto commuting to the Laboratory. Berkeley Lab has a well-developed infrastructure to support those who bicycle to work; specifically;

- Major Laboratory circulation routes include bike lanes.
- The Berkeley Lab shuttle accommodates bike transport.
- Bike racks are provided throughout the Laboratory.
- Showers are provided at a number of locations around the Laboratory.
- The LBNL Bicycle Coalition, a volunteer group at the Laboratory, are an organized bicycling group that encourage bicycle commuting through education and helping to improve facilities.

On-site amenities
Berkeley Lab provides many support services and amenities on-site, which reduces the number of stops during commutes and trips of people leaving the Laboratory to perform errands, including:

- ATM
- Cafeteria
- Guest housing (under development)
- Dental
- Employee activities, including recreation programs and facilities

Information and Marketing
Berkeley Lab provides information to employees about TDM programs and services through the following venues:

- Laboratory Newspaper “the View,” and e-news “Today at Berkeley Lab”
- Comprehensive pedestrian and bicycling maps
- Bulletin board displays
- E-mail bulletins
- Transit and access information in new employee orientation and Laboratory visitor packets
- Transportation fair
- Promotional events
- Employee advisory committee
- Spare the Air Campaign notifications

Phased Implementation of Expanded TDM Measures

Through a series of internal planning meetings as well as community meetings, a number of possible new TDM measures have been identified. Many require additional study to determine the cost and the TDM benefit before they can be implemented.

This Transportation Demand Management Program will be implemented in up to three phases, corresponding to the number of parking spaces to be added to the Laboratory as follows:

- **Phase 1:** increase from 2,300 to 2,410 spaces – maximum allowed under the current LRDP without additional environmental impact review
- **Phase 2:** increase from 2,410 to 2,675 spaces – maximum before local intersections are significantly impacted
- **Phase 3:** increase from 2,675 to 2,800 – maximum under the draft 2006 LRDP

It is hoped that the implementation of phases 1 and 2 will obviate the need for phase 3.

Implementation Phase 1:

increase from 2,300 to 2,410 spaces
(expansion of parking up to the level allowed in the 1987 LRDP)

The Laboratory may add up to 110 parking spaces under the current LRDP. Before this threshold is crossed, the Lab will undertake a number of the most basic TDM measures, as follows:

TDM Coordinator
Create a position of "TDM Coordinator" or "TDM Manager" who will monitor, plan, and implement TDM measures in coordination with parking and access. This person will oversee studies evaluating the cost and benefits of further TDM measures.

LBNL Transportation Committee
Form a committee to develop and implement TDM measures in conjunction with the TDM Coordinator position.

TDM, Traffic, and Parking Studies and Monitoring
Conduct an annual inventory of on-site parking spaces and track the number of net new spaces. Perform an annual gate count and commuter survey to more accurately profile the transportation modes used by Berkeley Lab commuters. Study service vehicle traffic to determine number of trips and vehicle modes of service and delivery vehicles. In conjunction with the City of Berkeley, monitor key intersections for traffic and pedestrian activity to assess impacts during Laboratory growth.

Additional Mass Transit Outreach
Investigate other forms of mass transit not currently being taken advantage of such as the SF Bay ferries and CalTrain.

TDM vs. Structured Parking Studies
Fund studies that compare the costs of more aggressive TDM measures vs. the cost of building parking structures – it may be cheaper to fund the TDM measures than to build parking structures.

Enhanced Information Campaign
Enhance informational campaigns to aggressively promote the use of alternatives to the single-occupant commuter vehicle with quarterly e-news and employee newspaper articles describing efficient alternatives and their outcomes of reduced traffic and preserved air quality benefits

Contractor Delivery Hours
Develop standardized contract specification information required in procurement / purchasing contracts to discourage or prohibit deliveries during commute hours, when these contracts involve delivery of goods to the Lab's site.

Bicycle Infrastructure
Expand bicycle racks at buildings and on Berkeley Lab shuttle buses if needed to meet the increased number of bicycle commuters.

Implementation Phase 2

Increase from 2,410 to 2,675 spaces
(expansion of parking up to significant impact level)

It is estimated that if more than 375 parking spaces beyond the current baseline of 2,300 are added to Berkeley Lab, key intersections in the City of Berkeley will be studied for increased traffic. Before this threshold is crossed, the Laboratory will continue to implement additional TDM measures that are determined to have sufficient benefit vs. cost. Those measures may include some combination of the following;

Parking Fee
Currently there is no fee for parking at the Laboratory, although permits are limited. Investigate charging a fee for parking to help discourage personal vehicle use and to pay for other TDM measures.

Shuttle Coordination Plan
Develop a coordinated shuttle plan in cooperation with UC Berkeley, Alta Bates Hospital, and the West Berkeley Transportation Management Agency/Bayer Corporation, all of whom operate shuttles, to see how coordinated shuttle scheduling could reduce overall impact for all.

UC Berkeley Shared Services
Investigate sharing additional services with UC Berkeley including the shuttles and parking to help reduce the overall impact.

Car Share
Investigate the use of Car Share service in addition to, or in lieu of, government-owned fleet vehicles, either outsourced or managed in-house, possibly using an on-line reservation system. Would provide reservable on-site automobiles for errands near LBNL.

Discount Group Pass Program
Sponsor an mass-transit deep discount group pass that would allow unlimited usage of regional mass transit systems, including both AC Transit and BART; modeled on the UC Berkeley BearPass (offered to UCB staff and faculty), the UC Berkeley ClassPass (offered to UCB students) or the City of Berkeley's EcoPass program (offered free to all City employees).

Enhanced Pretax Transportation Program
Enhance the "WageWorks" program already in effect with additional promotion and marketing as well as some subsidy by the Laboratory to further encourage use.

Enhanced Carpool/Vanpool
Create a more coordinated formal program for carpooling and vanpooling and offer incentives.

Alternative Fuels Program
Implement the use of alternative fuels such as biodiesel in the shuttle fleet and in government-owned Laboratory vehicles. Encourage and reward the use of alternative fuel vehicles in carpools and vanpools. Mandate the use of alternative fuel vehicles in contractor and construction vehicles.

Remote Parking
Create or Lease remote parking locations that could be serviced by the Berkeley Lab Shuttle in order to reduce on-site traffic and parking as well as traffic impacts in surrounding communities.

Preferential Parking
Dedicate preferential parking spaces to carpools and vanpools, encouraging their use.

Additional On-Site Amenities
Develop and provide additional support services and amenities on-site, to further reduce the number of stops during commutes and trips of people leaving the Laboratory to perform errands, such as:

- Child care
- Dry cleaning pick-up
- Gym

Implementation Phase 3

Increase from 2,675 to 2,800 spaces
(expansion of parking up to level allowed by 2006 LRDP)

If it is necessary to add more than 375 spaces to the Berkeley Lab main site within the time frame of the 2006 LRDP, key intersections within the City of Berkeley will be studied and if necessary, the Laboratory will consider additional options to ease traffic impacts. The following measures will be considered:

BART Bicycle Storage
Investigate the provision of additional bicycle storage lockers at BART stations that may be impacted by Berkeley Lab commuter traffic.

Critical Intersection Shared Funding

Investigate shared funding and prepare a plan for improving critical off-site intersections with funding shared among the Lab, other major institutions, and local jurisdictions (e.g. City of Berkeley, UC Berkeley, and LBNL).

Preparation of Updated Traffic Analysis

In addition to the TDM measures identified above, Berkeley Lab intends to prepare an updated traffic analysis pursuant to a "reopener" negotiated with the City of Berkeley to evaluate traffic impacts related to future development at the Lab. The updated traffic analysis will be prepared on the earliest to occur of ten years from the date that Berkeley Lab's Long Range Development Plan EIR is certified or the date upon which development at the Lab pursuant to the Long Range Development Plan reaches 375 net new parking spaces. When the earliest of these thresholds is reached, Berkeley Lab will conduct the new traffic study, circulate that traffic study for review subject to the California Environmental Quality Act, and consider whether further mitigation measures or modifications to the Long Range Development Plan should be adopted based upon that traffic study. The new traffic study may be conducted as part of a further project review or independently as a supplement to the Long Range Development Plan EIR. Consistent with this TDM Program, it is anticipated that the new traffic study will assist in reducing total vehicle trips to and within Berkeley Lab, reducing air emissions, traffic impacts, and parking demands.

APPENDIX G

U.S. Department of Energy Policy Statement on Nanoscale Safety

U.S. Department of Energy
Washington, D.C.

POLICY

DOE P 456.1

9-15-05

SUBJECT: SECRETARIAL POLICY STATEMENT ON NANOSCALE SAFETY

PURPOSE AND SCOPE

The safety of its employees, the public, and the environment is the Department's number one priority. This policy statement is issued to establish a framework for working safely with nanomaterials.

Nanomaterials exhibit unique properties that can affect physical, chemical and biological attributes. Much of the scientific information on the safety, health and environmental hazards of working with these materials is yet to be determined. With the establishment of the Department's Nanoscale Science Research Centers and other emerging programs, research and development in nanoscience will increase significantly for the foreseeable future.

POLICY

The Department of Energy (DOE) requires that all work with nanomaterials be conducted in a safe and responsible manner that protects workers, the public, and the environment. Thus, the Department must be prudent and follow a cautious approach in the production, use, and disposition of nanomaterials.

It is imperative that the Department's work with nanomaterials be conducted in a manner that encompasses the following attributes:

- DOE will adopt and implement, as appropriate, both existing and future environment, safety and health best practices, "National Consensus Standards," and guidance relating to nanotechnology developed by recognized standard-setting organizations. Further, any existing DOE Directives and Standards which contain provisions that are relevant to nanotechnology work must be appropriately applied.

- DOE and its contractors will identify and manage potential health and safety hazards and potential environmental impacts at sites through the use of existing Integrated Safety Management Systems, including Environmental Management Systems.

- DOE organizations working with nanomaterials will stay abreast of current research and guidance relating to the potential hazards and impacts of nanomaterials, and will ensure that this best current knowledge is reflected in the identification and control of these potential hazards and impacts at their facilities.

- DOE will continue to both support research on the environmental and safety and health impacts of nanomaterials, and participate in government-wide activities aimed at identifying and resolving potential environmental, safety, and health issues.

RESPONSIBILITIES

Everyone involved with nanotechnology research and development activities shares responsibility for protecting the safety and health of workers and the public, and in safeguarding the environment from the hazards presented by the conduct of their activities. Authorized DOE employees (or personnel) are responsible for conveying to contractors and grantees the expectation that appropriate programs must be in place to maintain a level of worker, public, and environmental safety consistent with the intent of this policy.

SAMUEL W. BODMAN
Secretary of Energy

APPENDIX H

Scientific Achievements at the Lawrence Berkeley National Laboratory

75 Milestones in 75 Years:
Achievements at the Lawrence Berkeley National Laboratory

- **Invention of the cyclotron** - circular particle accelerator that won the 1939 Nobel Prize in Physics for E.O. Lawrence
- **Technetium-99 discovered –** first artificial element created would become most widely used radioisotope in medicine
- **60-inch cyclotron built** – gave birth to the Crocker Radiation Laboratory and nuclear medicine
- **Neptunium and Plutonium discovered –** first transuranic elements produced, won 1951 Nobel Prize in chemistry for Edwin McMillan and Glenn Seaborg
- **Carbon-14 discovered –** became an atomic clock for dating human artifacts
- **184-inch synchrocyclotron built –** took the Rad Lab from UC Berkeley campus to current location in Berkeley Hills
- **First proton linear accelerator invented** - type of accelerator used in oncology clinics today for cancer treatments
- **Berkelium discovered** – radioactive rare earth metal named for the city of Berkeley
- **Anger camera invented –** Hal Anger develops the first gamma ray camera for imaging radioisotopes in tissue
- **Liquid-hydrogen bubble chamber invented –** won the 1960 Nobel Prize in Physics for its inventor, Donald Glaser
- **Bevatron built** – accelerator smashed the billion electron volt (GeV) barrier for protons
- **Antiproton discovered –** won 1959 Nobel Prize in Physics for Emilio Segrè and Owen Chamberlain
- **Antineutron discovered** – antimatter or mirror matter was extended to include the electrically neutral elementary particles
- **Photosynthesis path of carbon identified –** won the 1961 Nobel Prize in Chemistry for Melvin Calvin
- **Lawrencium discovered** - radioactive rare earth metal named after Berkeley Lab founder Ernest O. Lawrence
- **88-Inch Cyclotron opens –** still in use today for the study of ionizing radiation effects on space-based electronics
- **Chemical laser invented –** became one of the most versatile and widely used tools of science

- **Discovery of "resonance states" in elementary particles –** won for Luis Alvarez the 1968 Nobel Prize in Physics
- **Positron Emission Tomography breakthrough –** world's highest resolution PET scanner developed for diagnostics research
- **j/psi particle discovered –** a meson that contained the first evidence of the charm quark
- **Seaborgium discovered –** radioactive synthetic element named after Berkeley Lab Nobelist Glenn Seaborg
- **Bevalac created –** SuperHILAC and Bevatron accelerators are joined to accelerate heavy ions to relativistic energies
- **Time Projection Chamber invented –** TPCs remain the workhorse of high energy physics particle detectors
- **Superconducting magnet breaks TESLA record –** Lab becomes world leader in superconducting electromagnetic technology
- **Positron-Electron Project built at Stanford -** joint project with SLAC produces first matter-antimatter collider
- **Earthquake studies begin at Parkfield –** Lab becomes a leader in subsurface imaging technology
- **Ten Meter Telescope conceived –** proposed segmented reflecting mirror now used in the world's largest optical telescopes
- **SQUIDs invented –** superconducting quantum interference devices for measuring ultra-tiny magnetic fields
- **Smart Windows invented –** embedded electrodes enable window glass to respond to changes in sunlight
- **Dinosaur Die Out –** iridium anomaly at the K-T boundary links dinosaur extinction to asteroid collision with Earth
- **National Center for Electron Microscopy (NCEM) opens –** home to the world's most powerful electron microscopes, will produce first images of carbon atoms in a lattice
- **DOE-2 program created –** energy-saving computational program for modeling heating, lighting and air-conditioning costs
- **Collective flow observed –** first direct evidence that nuclear matter can be compressed to high temperature and density launches the search for a Quark Gluon Plasma
- **Crossed molecular beam research –** wins for Yuan T. Lee the 1988 Nobel Prize in Chemistry
- **NMR Magic Angle and Double-rotation invented –** first of a series of new techniques that will extend nuclear magnetic resonance technology from solids to liquids and gases
- **Good and bad cholesterol identified –** two forms of lipoproteins found in cholesterol, high-density and low-density, the former good, the latter bad for heart disease
- **Solid-state ballasts for fluorescent lamps –** high-frequency electronic ballasts lead to the commercial development of compact fluorescent lamps
- **MBE-4 inertital fusion energy experiments -** linac accelerates and focuses parallel heavy ion beams to 1 MeV, provides an alternative to magnetic fusion energy

- **Arctic soot discovered –** Lab aetholometers reveal large concentrations of radiation-absorbing black particles at the North Pole, demonstrates pollution is global issue
- **Random Vortex Method invented –** mathematical model describes turbulent flow, the most common form of motion in the universe
- **Next generation of aerogels created –** Lab develops materials that are 96-percent air, results in first commercial U.S. aerogel firm
- **Immortal human epithelial cell lines established –** creation of cells that live indefinitely in culture opens new doors to cancer research
- **Radon risk uncovered –** radon gas seeping into homes through basements found to pose substantial radiation hazard in some parts of the country
- **Center for Science and Engineering Education starts –** CSEE begins on-going outreach programs to teachers and students in K-12, community college, undergraduate and graduate science education programs
- **Extra Cellular Matrix theory proposed –** ground-breaking theory links breast cancer development to breakdown in the micro-environment surrounding breast cells
- **Human Genome Project begins –** Lab named one of two DOE centers for mapping and sequencing human genome, a project that will be successfully completed in 2003
- **Solid polymer batteries invented -** novel class of polymer cathodes makes possible a new family of lightweight rechargeable batteries
- **COBE satellite records seeds of early universe –** Lab detectors aboard NASA satellite reveal fluctuations in the cosmic microwave background that gave rise to today's galaxies - wins for George Smoot the 2006 Nobel Prize in Physics
- **Advanced Light Source opens –** generates world's brightest beams of soft x-rays and ultraviolet light for scientific research
- **Heart disease gene identified –** new evidence links atherosclerosis to a single dominant gene
- **ultrahard carbon-nitride –** new compound designed on basis of theoretical model is tougher than diamond
- **First view of DNA double-helix –** image of unaltered DNA gives scientists their first look at the double-helix
- **Kesterson Reservoir threat uncovered –** Lab discovery of selenium contamination of wildlife refuge by agriculture runoff exposes widespread ecological danger
- **First femtosecond x-ray beam –** pulse lengths of ALS beam sliced to barely a few hundred millionths of a billionth of a second
- **Sulfur lamp invented –** Lab scientists help produce molecular emitter four times more energy efficient and 700 times brighter than conventional incandescent bulbs
- **NERSC moves to Berkeley Lab –** Lab becomes host of National Energy Research Scientific Computing Center, flagship scientific computing facility for the Office of Science in the U.S. Department of Energy
- **Cell senescence linked to cancer –** bioassay enables scientists to identify senescent cells within living organisms and find link to cancer
- **Gammasphere unveiled –** world's most sensitive detector of gamma radiation inspires production of Hollywood blockbuster film, *The Hulk*
- **B factory conceived** – collaboration with SLAC to build first asymmetric particle collider, called B factory, which will go on to reveal first evidence of CP violation

- **Sickle cell and Down syndrome transgenic mice –** mouse models carrying human genes mimic sickle cell disease and link DYRK gene to mental retardation in Down syndrome
- **TCP/IP flow control algorithms –** algorithms developed at Lab substantially reduce network traffic congestion and are widely credited with saving the Internet from an otherwise inevitable congestion collapse
- **Top quark discovered –** Lab scientists part of two historic experiments at Tevatron, CDF and D-Zero, that find the last and most elusive of the six predicted quarks
- **UV water purifier prevents cholera outbreaks –** ultraviolet light quickly and cheaply disinfects water in remote locations
- **3-D computer model of Yucca Mountain –** hydrogeologic model shows Nevada mountain to be a sound choice for nuclear waste repository
- **Dark energy discovered –** Supernova Cosmology Project reveals antigravity force called "dark energy" that is causing the expansion of the universe to accelerate
- **First 3-D atomic-scale model of tubulin –** image reveals structure of flexible protein that enables biological cells to undergo mitosis and other critical functions
- **Front-end system for Spallation Neutron Source completed –** Lab completes work on accelerator that generates negative hydrogen ions for SNS and sends to Oak Ridge, TN.
- **First results from SNO show neutrino mass –** first year of data from SNO reveals a tiny mass for ghostlike subatomic particles
- **Hybrid solar cells developed –** nanotechnology combined with plastic electronics yields photovoltaic devices that can be mass-produced in a multitude of different shapes
- **Southern Ocean and Frio tests –** Lab begins carbon sequestration studies off the Antarctic coast and in deep brine aquifers near Houston, Texas
- **Lilliputian lasers invented –** UV light-emitting nanowire lasers measure 100 nanometers in diameter, or one-thousandth that of a human hair
- **Berkeley Lamp invented –** fluorescent table lamp reduces energy costs by 50-percent over conventional desk lamps
- **Synthetic biology breakthroughs** – first SB department at major institute creates synthetic genes for antimalaria and anti-AIDS superdrugs
- **World's smallest synthetic motor created** - rotational motor fashioned out of carbon nanotubes and gold measures less than 300 nanometers in length
- **Molecular Foundry opens –** DOE national user facility dedicated to design, synthesis and characterization of nanoscale materials

APPENDIX I
Intersection Level of Service Data

To save paper, this appendix is included in the electronic version of the Draft EIR but is not included in the hard copy version. A hard copy of this appendix (approximately 340 pages) is available upon request from Berkeley Lab, at (510) 486-5257.

This appendix contains the traffic count volumes on which the intersection level of service (LOS) calculations in the EIR were based, as well as those LOS calculations themselves.

To ensure that the previously counted turning movement volumes adequately represent current conditions, new traffic counts were undertaken at each of the study intersections in October 2006 (when UC Berkeley and City of Berkeley schools were in session). In general, the volumes counted in 2006 were lower than those counted previously, with 18 of 20 intersections having current volumes in both the a.m. and p.m. peak hours that were between 3 percent and 39 percent lower than those counted earlier. The average decline was 14 percent in the morning and 13 percent in the afternoon. Exceptions were at Centennial/Stadium Rim Way (a.m. peak hour, 5-percent increase, but overall volumes remain very low), and Dwight/Piedmont-Warring and College/Bancroft (p.m. peak hour, 9-percent and 4-percent increases, respectively, with little or no increase in the conflicting movements that determine level of service). At the Panoramic Way/Canyon Road/Stadium Rim Way intersection, a.m. peak-hour volumes were essentially unchanged (although p.m. peak-hour volumes declined by 20 percent between the 2003 and 2006 counts). All intersections where volumes increased between the prior counts and the 2006 counts currently operate (and will operate in the future) at good levels of service (LOS B or C). The October 2006 counts were also compared to the volumes counted for the UC Berkeley Southeast Campus Integrated Projects (SCIP) EIR (taken in January 2006). Once again, the current counts are lower, except at Centennial/Stadium Rim Way (a.m. peak hour, increase of 33 percent but, as stated above, the overall volume was low and the level of service remained good) and Bancroft/Gayley-Piedmont (p.m. peak hour, increase of 5 percent, but there was a decrease in conflicting movements that determine level of service).

Existing Conditions—A.M. Peak Hour
